RF Manual 16th edition

Application and design manual
for High Performance RF products
June 2012

NXP enables you to unleash the performance of next-generation RF and microwave designs

NXP's RF Manual is one of the most important reference tools on the market for today's RF designers. It features our complete range of RF products, from low- to high-power signal conditioning, organized by application and function, and with a focus on design-in support.

When it comes to RF, the first thing on the designer's mind is to meet the specified performance. NXP brings clarity to every aspect of your design challenge, so you can unleash the performance of your RF and microwave designs. NXP delivers a portfolio of high-performance RF technology that allows you to differentiate your product – no matter where in the RF world you are. That's why customers trust us with their mission-critical designs. Whether it's LDMOS and GaN for high-power RF applications or Si and SiGe:C BiCMOS for your small-signal needs, we've got you covered. Our broad portfolio of far-reaching technologies gives you the freedom to design with confidence.

Shipping more than four billion RF products annually, NXP is a clear industry leader in High Performance RF. From satellite receivers, cellular base stations, and broadcast transmitters to ISM (industrial, scientific, medical) and aerospace and defense applications, you will find the High Performance RF products that will help you realize a clear advantage in your products, your reputation, and your business.

So if you're looking to improve your RF performance, design a highly efficient signal chain, or break new ground with an innovative ISM application, NXP will help you unleash the performance of your next-generation RF and microwave designs.

UNLEASH^{RF}

What's new?

This RF Manual provides updated information on RF applications that are grouped as follows: wireless and broadband communication infrastructure, TV and satellite, portable devices, automotive, ISM, and aerospace and defense.

We describe in detail the new developments in our core technologies, QUBiC4 (SiGe:C) and LDMOS. We have also added GaN technology to our product offering; this key technology lets high-power amplifiers deliver very high efficiency in next-generation wireless communication systems.

New products include GaN power amplifiers, a complete line of overmolded plastic (OMP) RF power transistors and MMICs, and our eighth generation LDMOS transistors (Gen8). Next-generation devices and improved products include GPS LNAs, medium power amplifiers, IF gain blocks, satellite LNB ICs and CATV modules.

Our portfolio for the wireless communication infrastructure has expanded, with a comprehensive set of amplifiers (low noise, variable gain, medium power, and high power Doherty amplifiers), mixers, IQ modulators and synthesizers, so you can build a highly efficient signal chain for transmit line-ups and receive chains.

The Design Support section is updated and includes all available tools, documents, materials and links that ease the design-in of our products.

We're relentless in our commitment to RF innovation, and have the infrastructure and insight to inspire confidence in your performance-critical applications. We bring focus to complex RF problems so you are free to push the performance limits of your application, realize your design vision, and gain a competitive edge for your enterprise. What you are reading is more than a guide, it's a tool that lets you unleash your RF performance: the 16th edition of the RF Manual.

Kind regards,

John Croteau

Sr. Vice President & General Manager
Business Line High Performance RF

Contents

1	Products by application	9
1.1	Wireless communication infrastructure	9
1.1.1	Base stations (all cellular standards and frequencies)	9
1.1.2	Point-to-point communications	12
1.1.3	Repeater	14
1.2	Broadband communication infrastructure	15
1.2.1	CATV optical (optical node with multiple out-ports)	15
1.2.2	CATV electrical (line extenders)	16
1.3	TV and satellite	17
1.3.1	Network interface module (NIM) for TV reception	17
1.3.2	Basic TV tuner	19
1.3.3	Satellite outdoor unit, twin low-noise block (LNB) with discrete components	20
1.3.4	Satellite outdoor unit, twin low-noise block (LNB) with integrated mixer / oscillator / downconverter	21
1.3.5	Satellite multi-switch box - 4 x 4 (up to 16 x 16) / DiSEqC / SMATV	22
1.3.6	VSAT	23
1.4	Portable devices	25
1.4.1	GPS	25
1.4.2	FM radio	26
1.4.3	China Mobile Multimedia Broadcasting (CMMB) in UHF band 470 – 862 MHz	27
1.4.4	Cellular receiver	28
1.4.5	802.11n DBDC and 802.11ac WLAN	29
1.4.6	Generic RF front-end	30
1.5	Automotive	31
1.5.1	SDARS & HD radio	31
1.5.2	Remote keyless entry, RF generic front-end with dedicated antenna for reception and transmission	32
1.5.3	Tire pressure monitoring system	33
1.5.4	Car radio receiver (CREST ICs: TEF6860HL, TEF6862HL)	34
1.6	Industrial, scientific & medical (ISM)	35
1.6.1	Broadcast / ISM	35
1.6.2	E-metering, RF generic front-end with a single antenna / ZigBee	36
1.6.3	RF microwave furnace application	37
1.6.4	RF plasma lighting	38
1.6.5	Medical imaging	39
1.7	Aerospace and defense	40
1.7.1	Microwave products for L- and S-band radar and avionics applications	40

2	Focus applications, products & technologies	42
2.1	Wireless communication infrastructure	42
2.1.1	Build a highly efficient signal chain with RF components for transmit line-ups and receive chains	42
2.1.2	Digital wideband VGAs with high linearity & flexible current settings	44
2.1.3	Doherty amplifier technology for state-of-the-art wireless infrastructure	46
2.1.4	The new generation of LDMOS RF power for wireless infrastructures: NXP's Gen8	48
2.2	Broadband communication infrastructure	49
2.2.1	Connecting people, protecting your network: NXP's CATV C-family for the Chinese SARFT standard	49
2.2.2	Highly efficient line-up of 1 GHz GaAs modules for sustainable CATV networks	52
2.3	TV and satellite	54
2.3.1	LNAs with programmable gain & bypass option for improved tuner performance	54
2.3.2	Complete satellite portfolio for all LNB architectures	56
2.3.3	VSAT, 2-way communication via satellite	58
2.3.4	Low noise LO generators for microwave & mmWave radios	60
2.4	Portable devices	61
2.4.1	The best reception of GNSS signals with the smallest footprint	61
2.5	Industrial, scientific & medical	63
2.5.1	Medical applications driven by RF power	63
2.5.2	RF-driven plasma lighting	64
2.5.3	QUBiC4 Si and SiGe:C transistors for any RF function	65
2.5.4	Building on decades of innovation in microwave and radar	66
2.5.5	Digital broadcasting at its best	68
2.5.6	Setting the benchmark for ultra low-power and high-performance wireless connectivity solutions	69
2.6	Technology	70
2.6.1	The first mainstream semiconductor company to offer GaN products	70

2.6.2	Completing NXP's RF power transistor offering: products in plastic packages (OMP)	71
2.6.3	Looking for a leader in SiGe:C? You just found us!	72
2.6.4	High-performance, small-size packaging enabled by NXP's leadless package platform and WL-CSP technology	74

Application diagram

The block diagram above shows transmit (upper part, Tx) and receive (lower part, Rx) functions of a base station, and includes the Tx feedback function (middle part, Tx feedback).

The signals generated in the "Digital Baseband & Control" block follow the requirements of the air-interface standard. These signals are interfaced to the DAC via serial interface SER. The SER can use the LVDS or JEDEC standard. After the signals are fed to the I-DAC and Q-DAC, they are converted to the analog domain. Before the I and Q signals enter the IQ modulator, they are first low-pass filtered to remove any aliasing signals. At the IQ modulator, the signals are up-converted to RF using an LO signal coming from the PLL/VCO device, typically called the LO generator. Due to device aging and variation in cell load, the up-converted signals are fed to the VGA to control the power level. An additional band-pass filter is needed to remove the out-of-band spurs. The clean signal is fed to the RF power board, where the desired transmit power is made. Finally, the RF power signal is fed to the antenna via a duplexer.

Directly after the final-stage amplifier, a signal coupler picks up a certain amount of the RF signal, which is attenuated and then down-mixed using the IF mixer. This signal is called the observation signal, and is used to derive coefficients for the digital pre-distortion algorithm. Since power levels vary, the observation is first fed to the VGA to control the power level, and after band-pass filtering, the signal is converted to the digital domain using an ADC. The same serial interface is used to send the digital signals to the baseband processor.

At the receiver, the received signal directly after the duplexer is fed to the LNA for direct amplification, since the received signal level is quite low. If the first LNA is mounted in the tower top, a long RF cable is used to interface the RF signals with a base transceiver station (BTS). A second LNA is used to amplify the received signals. Band-pass filtering is applied to reduce the out-of-band signals levels before these signals are applied to the IF mixer. Signal levels that change dramatically require a VGA to maintain the full scale ranges of the I-ADC and Q-ADC for optimal conversion performance. Low-pass filtering is used before the ADC to remove the aliasing signals. These digital signals are interfaced to the baseband using a serial interface such as JEDEC.

The sample clocks and LO signals are derived from clock cleaners and PLLs respectively. This is denoted as Clock and PLL / VCO in the block diagram. This set-up is required to make a synchronized system. Typically denoted in SNRs, and in order to improve reception quality, the receive function is equipped with a second receiver, called a diversity receiver.

Product highlight:

BLF8G10LS-160

160 W LDMOS power transistor for base W-CDMA base station and multi-carrier applications at frequencies from 920 to 960 MHz.

Features

- ▶ Excellent ruggedness
- ▶ High efficiency
- ▶ Low R_{th} providing excellent thermal stability
- ▶ Designed for broadband operation (920 to 960 MHz)
- ▶ Lower output capacitance for improved performance in Doherty applications
- ▶ Low memory effects for excellent pre-distortability
- ▶ Internally matched for ease of use
- ▶ Integrated ESD protection
- ▶ Compliant to Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC

Products by application

Product highlight: Digital VGAs BGA7204 & BGA7210

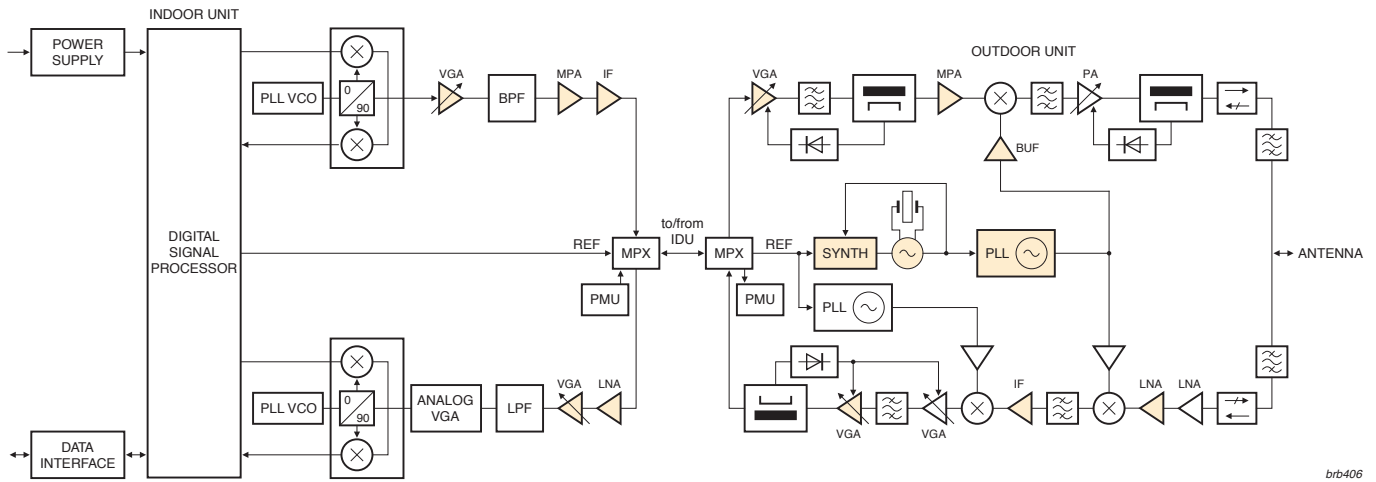

These 6-bit digital VGAs offer high linearity (35 dBm @ 2.2-2.8 GHz) and high output power (23 dBm @ 2.2-2.8 GHz) across a large bandwidth without external matching. Smart routing with no connection crosses simplifies design and decreases footprint by 25%. The unique power-save mode can effectively reduce the current consumption in TDD systems up to 45%. The BGA7210 adds flexible current distribution across its two amplifiers, depending on the attenuation state, to save current.

Features

- ▶ Internally matched for 50 Ω
 - BGA7204 = 0.4 to 2.75 GHz
 - BGA7210 = 0.7 to 3.8 GHz
- ▶ High maximum power gain
 - BGA7204 = 18.5 dB
 - BGA7210 = 30 dB
- ▶ High output third-order intercept, IP_{3o}
 - BGA7204 = 38 dB
 - BGA7210 = 39 dB
- ▶ Attenuation range of 31.5 dB, 0.5 dB step size (6 bit)
- ▶ Fast switching power-save mode (power-down pin)
- ▶ Digitally controlled current setting from 120 to 195 mA with an optimum at 185mA (BGA7210 only)
- ▶ Simple control interfaces (SPI)
- ▶ ESD protection on all pins (HBM 4 kV; CDM 2 kV)

NXP BTS Tx component demonstrator board

Product highlight:

BGA7350 MMIC variable-gain amplifier

The BGA7350 MMIC is a dual independent digitally controlled IF variable-gain amplifier (VGA) operating from 50 to 250 MHz. Each IF VGA amplifies with a gain range of 24 dB and, at its maximum gain setting, delivers 17 dBm output power at 1 dB gain compression with superior linear performance. The BGA7350 is optimized for a differential gain error of less than ± 0.1 dB for accurate gain control and has a total integrated gain error of less than ± 0.4 dB. It is housed in a 32-pin leadless HVQFN package (5 x 5 mm).

Features

- ▶ Dual independent digitally controlled 24 dB gain range VGAs, with 5-bit control interface
- ▶ 50 to 250 MHz frequency operating range
- ▶ Gain step size: 1 dB \pm 0.1 dB
- ▶ 18.5 dB power gain
- ▶ Fast gain stage switching capability
- ▶ 17 dBm output power at 1 dB gain compression
- ▶ 5 V single supply operation with power-down control
- ▶ Logic-level shutdown control pin reduces supply current
- ▶ ESD protection at all pins
- ▶ Unconditionally stable

PLL + VCO (LO generator)	MMIC	-131 dBc/Hz @ 1 MHz offset @ 5.3 GHz	SOT617	BGX7300*

* Check status in section 3.1, as this type is not yet released for mass production

Product highlight:

BGX7221 MMIC dual down-mixer

The BGX7221 combines a pair of high performance, high linearity down-mixers for use in receivers that have a common local oscillator used with, for example, main and diversity paths. The device covers frequency bands from 1700 to 2700 MHz with an extremely flat behavior.

Features

- ▶ 8.5 dB conversion gain over all bands
- ▶ 13 dBm input, 1 dB compression point
- ▶ 25.5 dBm input third-order intercept point
- ▶ 10 dB (typ) small signal noise figure
- ▶ Integrated active biasing
- ▶ Single +5 V supply operation
- ▶ Power-down per mixer with hardware control pins
- ▶ Low bias current in power-down mode
- ▶ Matched 50 Ω single-ended RF and LO input impedances
- ▶ ESD protection at all pins

Product highlight: BGO807CE optical receiver

The BGO807CE is an integrated optical receiver module that provides high output levels and includes an integrated temperature-compensated circuitry. In your optical node design, BGO807CE enables a high performance/ price ratio and ruggedness. When upgrading an HFC network from analog to digital, our BGO807CE is the perfect fit.

Features

- ▶ Excellent linearity
- ▶ Low noise
- ▶ Excellent flatness
- ▶ Standard CATV outline
- ▶ Rugged construction
- ▶ Gold metallization ensures excellent reliability
- ▶ High optical input power range

Product highlight:

CGD1046Hi

Capable of supporting high output power, the CGD1046Hi is primarily designed for use in fiber deep-optical-node applications (N+1/2/3). This 1 GHz hybrid amplifier solution offers an extended temperature range, high-power overstress capabilities in case of surges, and high ESD levels. The result is a low cost of ownership, with durability and superior ruggedness.

Features

- ▶ High output power
- ▶ High power gain for power doublers
- ▶ Extremely low noise
- ▶ Dark Green products
- ▶ GaAs HFET dies for high-end applications
- ▶ Rugged construction
- ▶ Superior levels of ESD protection
- ▶ Integrated ringwave protection
- ▶ Design optimized for digital channel loading
- ▶ Temperature-compensated gain response
- ▶ Optimized heat management
- ▶ Excellent temperature resistance

1.3 TV and satellite

1.3.1 Network interface module (NIM) for TV reception

Application diagram

Recommended products

Function	Product	V _{cc} (V)	Gain (db)	Package	Type
LNA	MMIC	5	10	SOT363	BGU7031
			-2		BGU7032
		5	10	SOT363	BGU7033
			-2		
		3.3	10	SOT363	BGU7041
			-2		BGU7042
		3.3	14	SOT363	BGU7044
			-2		BGU7045

Product highlight:

Make a high-performance active splitter in a NIM tuner with the BGU703x/ BGU704x

Today's TV tuners require complicated signal handling and benefit from flexibility in design. The front-end of a TV signal receiver is no longer just a tuned receiver, but has evolved into an RF network interface module (NIM) with tuned demodulators, active splitters,

and remodulators. The active splitter requires an LNA with excellent linearity. NXP has developed two new series of LNA/VGA MMICs (BGU703x/BGU704x), designed especially for high linearity (P3O of 29 dBm) in low-noise applications such as an active splitter in a NIM tuner. The BGU703x family operates at a supply voltage of 5 V and is intended for use with normal can tuners. The BGU704x family operates at 3.3 V and works seamlessly with our Si tuner ICs, which also operate at 3.3 V.

Recommended products

Function	Product	Package	Type	
RF Switch / PLT switch	MOSFET	5 V silicon RF switch	SOT23	BF1107
			SOT143B	BF1108
			SOT143R	BF1108R
			SOT343	BF1108W
			SOT343R	BF1108WR
		3.3 V silicon RF switch	SOT143B	BF1118
			SOT143R	BF1118R
			SOT343	BF1118W
			SOT343R	BF1118WR

Function	Product	Package	Type	
AGC control amplifier	MOSFET	2-in-1 with band switch @ 5 V	SOT363	BF1215
		2-in-1 @ 5 V	SOT363	BF1216
		5 V	SOT343	BF1217

Note: given that there is now an LNA before the MOSFET, the gain of these MOSFETs is made slightly lower and the cross-modulation somewhat higher. That way, the MOSFET is not under AGC even under nominal RF input level.

BGU703x evaluation board

Product highlight:

Save energy with the BF11x8

The BF11x8 series are small-signal, RF-switching MOSFETs that can be used to switch RF signals up to 1 GHz. Using the BF11x8 series as an RF switch saves a considerable amount of energy. When a recording device (DVD-R, HDD-R, VCR, DVR) is powered off, viewers can still watch TV, although the antenna is looped via the recording device. Without the BF11x8, the antenna signal is lost. When power

to the recording device is on, the BF11x8 is open, so the RF signal travels via the recording device to the TV tuner. When power to the recording device is off, the BF11x8 closes. This ensures that the RF signal is looped through directly to the TV tuner and guarantees TV reception. This saves energy because the recording device can be powered off.

BGU7045 1 GHz wideband low-noise amplifier with bypass

The BGU7045 MMIC is a 3.3 V wideband amplifier with bypass mode. It is designed specifically for high-linearity, low-noise applications over a frequency range of 40 MHz to 1 GHz. It is especially suited to set-top box applications. The LNA is housed in a 6-pin SOT363 plastic SMD package.

Features

- ▶ Internally biased
- ▶ Noise figure of 2.8 dB
- ▶ High linearity with an IP_{3O} of 29 dBm
- ▶ 75 Ω input and output impedance
- ▶ Power-down during bypass mode
- ▶ Bypass mode current consumption < 5 mA
- ▶ ESD protection > 2 kV HBM and >1.5 kV CDM on all pins

The BGA28xx IF gain blocks are silicon Monolithic Microwave Integrated Circuit (MMIC) wideband amplifiers with internal matching circuitry in a 6-pin SOT363 plastic SMD package.

Features

- ▶ No output inductor necessary when used at the output stage
- ▶ Internally matched to 50 Ω
- ▶ Reverse isolation > 30 dB up to 2 GHz
- ▶ Good linearity with low second- and third-order products
- ▶ Unconditionally stable (K > 1)

Function	Product	Package	Type
Mixer/oscillator/downconverter	RF IC	SOT763	TFF1014HN

Product highlight:

Industry's lowest-power integrated Ku-band downconverters

These Universal DVB-S compliant Ku-band downconverters consume about 50% less current (52 mA) than other integrated solutions. They are fully integrated (PLL synthesizer/mixer/IF gain block) and RF tested – which results in significantly decreased manufacturing time. Stability of the local oscillator is guaranteed, which improves overall system reliability over temperature and time, and eliminates the need for manual alignment in production.

Features

- ▶ Ultra-low current consumption ($I_{CC} = 52 \text{ mA}$)
- ▶ Low phase noise (1.5° RMS typ)
- ▶ Integration bandwidth from 10 kHz to 13 MHz
- ▶ Small PCB footprint
 - DHVQFN16 package (2.5 x 3.5 x 0.85 mm)
 - Only 7 external components
 - No inductors necessary

Product highlight:

PIN diodes for switching matrix

In addition to delivering outstanding RF performance, this component simplifies design-in because of its extremely low forward resistance, diode capacitance, and series inductance. Significant board space is saved by supplying a range of highly compact package options, including SOD523, SOD323 and leadless SOD882D.

Features

- ▶ High isolation, low distortion, low insertion loss
- ▶ Low forward resistance (R_d) and diode capacitance (C_d)
- ▶ Ultra-small package options

TFF1003HN Low phase noise LO generator for VSAT applications

The TFF1003HN is a Ku-band frequency generator intended for low phase noise local-oscillator (LO) circuits for Ku-band VSAT transmitters and transceivers. The specified phase noise complies with IESS-308 from Intelsat.

Features

- ▶ Phase noise compliant with IESS-308 (Intelsat)
- ▶ LO generator with VCO range: 12.8 to 13.05 GHz
- ▶ Input signal 50 to 816 MHz
- ▶ Divider settings: 16, 32, 64, 128, or 256
- ▶ Output level -5 dBm; stability ± 2 dB
- ▶ Third- or fourth-order
- ▶ Internally stabilized voltage references for loop filter

BGU8007 SiGe:C LNA MMIC for GPS, GLONASS, and Galileo

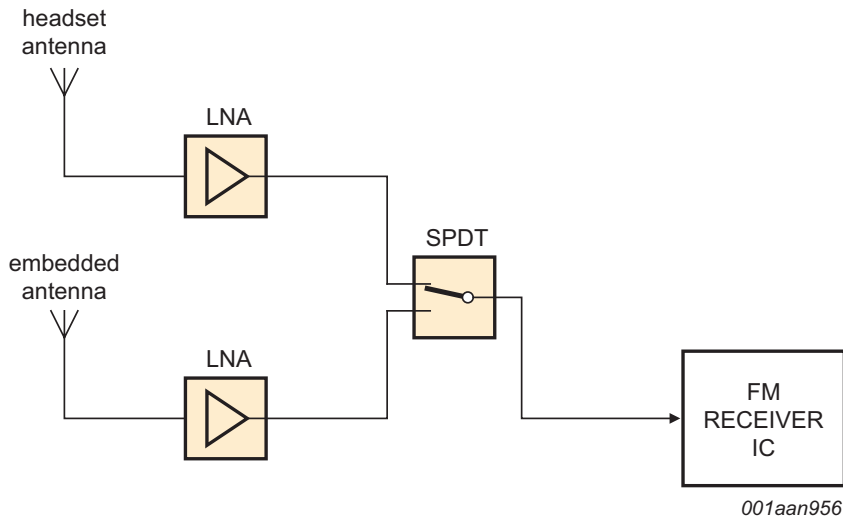

The BGU8007 is a low-noise amplifier (LNA) for GNSS receiver applications in a plastic leadless 6-pin extremely-small SOT886 package. It requires only one external matching inductor and one external decoupling capacitor.

Features

- ▶ Covers full GNSS L1 band, from 1559 to 1610 MHz
- ▶ Noise figure (NF) = 0.75 dB
- ▶ Gain = 19.5 dB
- ▶ High 1 dB compression point of -12 dBm
- ▶ High out-of-band IP₃ of 4 dBm
- ▶ Supply voltage 1.5 to 2.85 V
- ▶ Power-down mode current consumption < 1 μA
- ▶ Optimized performance at low supply current of 4.8 mA
- ▶ Integrated temperature stabilized bias for easy design
- ▶ Requires only one input matching inductor and one supply decoupling capacitor

Product highlight: BGU6102 MMIC wideband amplifier

The BGU6102 is an unmatched MMIC featuring an integrated bias-enable function and a wide supply voltage. It is part of a family of three products (BGU6101, BGU6102, BGU6104), and is optimized for 2 mA operation.

Features

- ▶ Applicable between 40 MHz and 4 GHz
- ▶ High ohmic FM LNA: 13 dB gain and 1.0 dB NF at 100 MHz
- ▶ 50 Ω FM LNA: 15 dB gain and 1.3 dB NF at 100 MHz
- ▶ Integrated temperature-stabilized bias for easy design
- ▶ Bias current configurable with external resistor
- ▶ Power-down mode current consumption < 6 μ A
- ▶ ESD protection > 1 kV Human Body Model (HBM) on all pins
- ▶ Supply voltage from 1.5 to 5 V

			SOT1209	BGU6102 BGU6104

Product highlight: BGU7003W MMIC wideband amplifier

The BGU7003W MMIC is a wideband amplifier in SiGe:C technology for high-speed, low-noise applications. It is housed in a plastic leadless 6-pin extremely thin small outline SOT886 package.

Features

- ▶ Low-noise, high-gain microwave MMIC
- ▶ Bias current configurable with external resistor
- ▶ Noise figure NF = 1.2 dB at 600 MHz
- ▶ Insertion power gain = 19.5 dB at 600 MHz
- ▶ Power-down mode current consumption < 1 μ A
- ▶ Optimized performance at low supply current of 5 mA
- ▶ ESD protection > 1 kV HBM on all pins

BGU7003 MMIC wideband amplifier

The BGU7003 MMIC is a wideband amplifier in SiGe:C technology for high-speed, low-noise applications. It is housed in a plastic leadless 6-pin extremely thin small outline SOT886 package.

Features

- ▶ Applicable between 40 MHz and 6 GHz
- ▶ LTE LNA: 1 dB NF, 18.5 dB gain and -5 dBm IIP3 at 750 MHz
- ▶ Integrated temperature-stabilized bias for easy design
- ▶ Bias current configurable with external resistor
- ▶ Power-down mode current consumption < 1 μ A
- ▶ ESD protection > 1 kV Human Body Model (HBM) on all pins

BFU760F NPN silicon germanium microwave transistor

The BGU760F is part of the family of 6th (Si) and 7th (SiGe:C) generation RF transistors and can be used to perform nearly any RF function. These next-generation wideband transistors offer the best RF noise figure versus gain performance, drawing the lowest current. This performance allows for better signal reception at low power and enables RF receivers to operate more robustly in noisy environments.

Features

- ▶ System optimized gain of 12.5 dB @ 2.4 GHz and 11 dB @ 5.5 GHz
- ▶ Low noise figure (NF) of 1.1 dB @ 2.4 GHz and 5.5 GHz
- ▶ High input 1 dB gain compression ($P_{i(1dB)}$) of -8 dBm @ 2.4 GHz and -5 dBm @ 5.5 GHz
- ▶ High input third order intercept point IP₃ of +3 dBm @ 2.4 GHz and +8 dBm @ 5.5 GHz
- ▶ Only 8 external components required

Varicap diodes as VCO

Varicap diodes are principally used as voltage varicap capacitors, with their diode function a secondary option. These devices are ideal for voltage controlled oscillators (VCOs) in ISM band applications.

Features

- ▶ Excellent linearity
- ▶ Excellent matching
- ▶ Very low series resistance
- ▶ High capacitance ratio

BGU6101 MMIC wideband amplifier

The BGU6101 is an unmatched MMIC featuring an integrated bias-enable function and a wide supply voltage. It is part of a family of three products (BGU6101, BGU6102, BGU6104), and is optimized for 2 mA operation.

Features

- ▶ Applicable between 40 MHz and 6 GHz
- ▶ 13 dB gain and 0.8 dB NF at 450 MHz
- ▶ 50 Ω FM LNA: 15 dB gain and 1.4 dB NF at 100 MHz
- ▶ Integrated temperature-stabilized bias for easy design
- ▶ Bias current configurable with external resistor
- ▶ Power-down mode current consumption < 1 μA
- ▶ ESD protection > 1 kV Human Body Model (HBM) on all pins

Product highlight:

BF862 junction field effect transistor

Our tuning portfolio contains advanced products for car radio reception applications and in-vehicle media platforms. The NXP devices for this application ensure excellent reception quality and ease of design-in. Performance is demonstrated in reference designs. The high-performance junction FET BG862 is specially designed for AM radio amplifiers.

Features

- ▶ High transition frequency and optimized input capacitance for excellent sensitivity
- ▶ High transfer admittance resulting in high gain
- ▶ Encapsulated in the versatile and easy-to-use SOT23 package

Product highlight: BLF578XR Power LDMOS transistor

Designed for broadband operation, this 1400 W extremely rugged LDMOS power transistor supports broadcast and industrial applications in the HF to 500 MHz band. This product is an enhanced version of the BLF578. It uses NXP's XR process to provide maximum ruggedness capability in the most severe applications without compromising RF performance.

Features

- ▶ Output power = 1400 W
- ▶ Power gain = 23 dB
- ▶ High Efficiency = 69 %
- ▶ Integrated ESD protection
- ▶ Excellent ruggedness
- ▶ Excellent thermal stability

BGA7127 MMIC medium power amplifier

The BGA7127 MMIC is a one-stage driver amplifier offered in a low-cost, ultra-small SOT908 leadless package. It delivers 27 dBm output power at 1 dB gain compression and superior performance for various narrowband-tuned application circuits at frequencies up to 2700 MHz.

Features

- ▶ Operating range: 400 to 2700 MHz
- ▶ 16 dB small signal gain at 2 GHz
- ▶ 27 dBm output power at 1 dB gain compression
- ▶ Integrated active biasing
- ▶ 3.3 / 5 V single-supply operation
- ▶ Simple quiescent current adjustment
- ▶ 1 μ A shutdown mode

Product highlight:

New family for ISM 2.45 GHz

NXP's 6th and 7th generation LDMOS technology, along with advanced packaging concepts, enables power amplifiers that deliver best-in-class performance at 2.45 GHz. The unsurpassed ruggedness and low thermal resistance, along with the intrinsic efficiency of the LDMOS process, make these transistors ideally suited for furnace applications.

Features

- ▶ Excellent ruggedness
- ▶ Consistent device performance
- ▶ Low thermal resistance for unrivalled reliability
- ▶ Ease of design

Product highlight:

LDMOS enables RF lighting

NXP's 50 V high-voltage LDMOS process enables highest power at the extreme ruggedness levels necessary for this kind of application. BLF578: 1200 W CW operation - highest power LDMOS

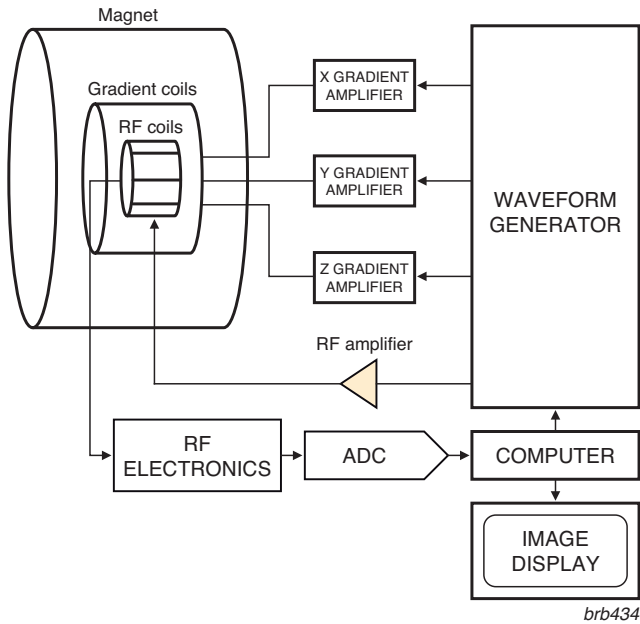

Features

- ▶ Highest power device
- ▶ Unprecedented ruggedness
- ▶ Low thermal resistance for reliable operation
- ▶ Consistent device performance
- ▶ Broadband device for flexible use

Product highlight: LDMOS in emerging medical applications

NXP's line of 50 V high-voltage LDMOS devices enables highest power output and features unequalled ruggedness for pulsed operation in MRI and NMR applications. The high power densities enable compact amplifier design.

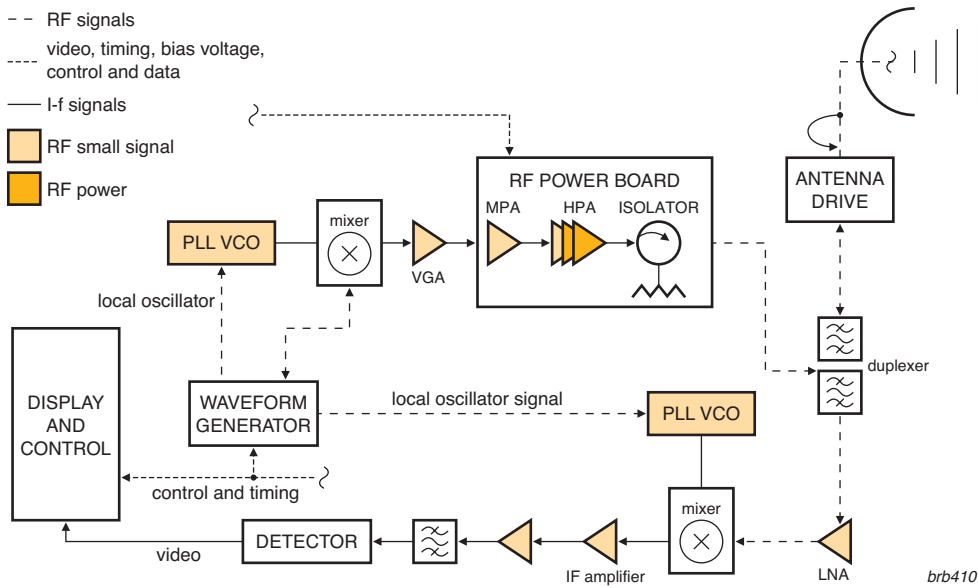

Features

- ▶ Best broadband efficiency
- ▶ Highest power (density) devices
- ▶ Unrivalled ruggedness
- ▶ Consistent device performance

Product highlight:

BLS7G2729L-350P LDMOS S-band radar power transistor

Designed for S-band operation (2.7 to 2.9 GHz), this internally matched LDMOS power transistor for radar applications delivers an output power of 350 W and a power gain of 13.5 dB at an efficiency of 50 %.

Features

- ▶ Easy power control
- ▶ Integrated ESD protection
- ▶ High flexibility with respect to pulse formats
- ▶ Excellent ruggedness
- ▶ Excellent thermal stability

Product highlight: BGA28xx-family of IF gain blocks

The BGA28xx IF gain blocks are silicon Monolithic Microwave Integrated Circuit (MMIC) wideband amplifiers with internal matching circuitry in a 6-pin SOT363 plastic SMD package.

Features

- ▶ No output inductor necessary when used at the output stage
- ▶ Internally matched to 50 Ω
- ▶ Reverse isolation > 30 dB up to 2 GHz
- ▶ Good linearity with low second order

2. Focus applications, products & technologies

2.1 Wireless communication infrastructure

2.1.1 Build a highly efficient signal chain with RF components for transmit line-ups and receive chains

As a global leader in RF technology and component design, NXP Semiconductors offers a complete portfolio of RF products, from low- to high-power signal conditioning that delivers advanced performance and helps simplify your design and the development process. Our solutions range from discrete devices to modular building blocks, so you can design a highly efficient signal chain.

State-of-the-art QUBiC4

NXP's industry-leading QUBiC4 technology, available since 2002, has been widely deployed in the field and offers more consistent parameter performance compared to GaAs technology. It speeds the migration from GaAs to silicon and delivers more functionality in less space. High integration reduces the design footprint and enables more cost-competitive designs. It also improves reliability and offers significant savings in manufacturing expenditures.

Application diagram of base station (all cellular standards and frequencies)

The block diagram below shows base station transmit (upper part, Tx) and receive (lower part, Rx) functions, and includes the Tx feedback function (middle part, Tx feedback).

Digital wideband VGAs with high linearity & flexible current settings

These 6-bit digital VGAs (BGA7204 & BGA7210) offer high linearity (35 dBm @ 2.2-2.8 GHz) and high output power (23 dBm @ 2.2-2.8 GHz) across a large bandwidth without external matching. Smart routing with no connection crosses simplifies design and decreases footprint by 25%.

The unique power-save mode can effectively reduce the current consumption in TDD systems up to 45%. The BGA7210 adds flexible current distribution across its two amplifiers, depending on the attenuation state, to save current.

Dual digital IF VGAs

The BGA7350 and BGA7351 are dual, independently controlled receive IF VGAs that operate from 50 to 250 MHz. Integrated matching improves performance in the receiver chain, because the VGA can drive the filter directly into the analog-to-digital converter to ensure a constant input level. The BGA7350 has a gain range of 24 dB, while the BGA7351 has a range of 28 dB. For both devices, the maximum gain setting delivers at least 16 dBm output power at 1 dB gain compression (P1dB). For gain control, each amplifier uses a separate digital gain-control code, which is provided externally through two sets of five bits. The resulting gain flatness is 0.1 dB.

Medium power amplifier

The NXP MPAs (BGA7x2x/BGA7x3x) are based on a one-stage amplifier, available in a low-cost surface-mount package. It delivers a set of available output power from 24 to 30 dBm. All cover the frequency range from 400 to 2700 MHz.

Low-noise amplifiers up to 2.8 GHz

Designed for high linearity and low noise, these monolithic SiGe:C BiCMOS LNAs (BGU7051, BUG7052 & BGU7053) deliver 18-24 dB gain, 3-5 dB more gain than equivalents, along with low power consumption. The RF input power overdrive of 20 dBm and the high ESD protection (HBM 4 kV; CDM 2 kV) make these devices extremely rugged. Integrated biasing circuitry, 3.3 V supply voltage and low external component count (only 6 capacitors) ensures easy system integration.

Integrated base station LNAs with lowest NF for the complete LNA chain

NXP provides the industry's only fully Integrated base station LNA that can be tailored to the needs of individual OEMs for optimal fit in their Rx line-ups. By integrating three stages in one monolithic design, these SiGe:C BiCMOS LNAs (BGU706x) deliver the industry's lowest noise figure for a receive chain (0.9 dB), while saving up to 80% in component cost. Additionally, the analog gain control up to 35 dB, RF input power overdrive of 10-15 dBm, and high linearity (0.9-2.5 dBm IP3I at maximum gain) make them very suitable in small cell sizes.

IQ modulators

The BGX7100 and BGX7101 devices combine high performance, high linearity I and Q modulation paths for use in radio frequency up-conversion. It supports RF frequency outputs in the range from 400 to 4000 MHz. The BGX710x IQ modulator is performance-independent of the IQ common mode voltage. The modulator provides a typical output 1 dB compression point (PL(1dB)) value of 12 dBm and a typical 27 dBm output third-order intercept point (IP₃). Unadjusted sideband suppression and carrier feed through are 50 dBc and -45 dBm respectively. A hardware control pin provides a fast power-down/power-up mode functionality which allows significant power saving. The BGX7101 is 4 dB higher gain compared to the BGX7100.

Dual mixers

The BGX722x device combines a pair of high-performance, high-linearity down-mixers for use in receivers having a common local oscillator (e.g. having main and diversity paths). Each mixer provides an input 1 dB compression point (P1dB) above 13 dBm, with an input third-order intercept point (IIP3) of 26 dBm. The small-signal noise figure (NF) is below 10 dB whereas under large signal blocking conditions the NF is typically 19 dB. Isolation between mixers is at least 40 dB.

Synthesizer with an integrated VCO (LO generator)

The BGX7300 is a low phase noise wideband synthesizer with an integrated VCO which allows the implementation of an integer-N or fractional-N Phase-Locked Loop (PLL). The integrated voltage controlled oscillator (VCO) supports a fundamental frequency range from 2.2 GHz up to 4.4 GHz. The BGX7300 has dual differential RF outputs, each with output power up to +5 dBm. The VCO frequency can be divided by 1/2/4/8/16/32 before being fed to the RF outputs. Hence the generated output frequency can be as low as 68.75MHz. For isolation purpose, each RF output can be muted or forced into power-down mode using a hardware pin or SPI software control. A dedicated differential input stage lets the BGX7300 work with an external VCO. Most of the characteristics are programmable via a 3- or 4-wire Serial Peripheral Interface bus (SPI). Each VCO is powered from an internally regulated voltage source providing sufficient power supply rejection. The device is designed to operate from 3.3 V nominal supply voltage connected to the supply pins.

Selection guides of the listed components are available in Chapter 3 (3.4.1 & 3.4.2).

2.1.2 Digital wideband VGAs with high linearity & flexible current settings

NXP digital VGAs BGA7204 & BGA7210

These 6-bit digital VGAs offer high linearity (35 dBm @ 2.2-2.8 GHz) and high output power (23 dBm @ 2.2-2.8 GHz) across a large bandwidth without external matching. Smart routing with no connection crosses simplifies design and decreases footprint by 25%. The unique power-save mode can effectively reduce the current consumption in TDD systems up to 45%. The BGA7210 adds flexible current distribution across its two amplifiers, depending on the attenuation state, to save current.

Key features

- ▶ Internally matched for 50 Ω
 - BGA7204 = 0.4 to 2.75 GHz
 - BGA7210 = 0.7 to 3.8 GHz
- ▶ High maximum power gain
 - BGA7204 = 18.5 dB
 - BGA7210 = 30 dB
- ▶ High output third-order intercept, $IP3_o$
 - BGA7204 = 38 dBm
 - BGA7210 = 39 dBm
- ▶ Attenuation range of 31.5 dB, 0.5 dB step size (6 bit)
- ▶ High output power, $P_{L(1dB)}$
 - BGA7204 = 21 dBm
 - BGA7210 = 23 dBm
- ▶ Fast switching power-save mode (power down pin)
- ▶ Digitally controlled current setting from 120 to 195 mA with an optimum at 185mA (BGA7210 only)
- ▶ Simple control interfaces
 - BGA7204 SPI and parallel
 - BGA7210 SPI
- ▶ ESD protection on all pins (HBM 4 kV; CDM 2 kV)
- ▶ HVQFN32 (5 x 5 x 0.85 mm)

Key benefits

- ▶ Wideband operation supports platforms with multiple frequency ranges
- ▶ Smart lead routing produces simpler design, decreases footprint by 25%
- ▶ Power-save mode can reduce current consumption in TDD systems up to 45%
- ▶ Flexible current setting (BGA7210) saves power
- ▶ Monolithic design enables high quality

Applications

- ▶ GSM, W-CDMA, WiMAX, LTE base stations
- ▶ Wireless point-to-point and repeaters
- ▶ Cable modem termination systems
- ▶ Temperature-compensation circuits

OM7921 – BGA7210 customer evaluation kit
(also available OM7922 – BGA7204 CEK)

The NXP BGA7204 and BGA7210 are monolithic digital variable-gain amplifiers (VGAs) that operate over an extremely wide range with high linearity and high output power.

Designed for the transmit path of wireless architectures, these VGAs can be used to control the power level to the power amplifier. The up-converted signals are fed to the VGA, and thus help compensate for variations in cell load and the presence of aging infrastructure equipment.

The BGA7204 operates in the range between 0.4 and 2.75 GHz, while the BGA7210 operates between 0.7 and 3.8 GHz. By supporting more than 2 GHz of bandwidth, these devices can be used to populate several frequency bands.

An integrated power-save mode makes it possible to reduce consumption even more, to just 15 mA during a receive slot. This can effectively reduce the current consumption in Time Division Duplexing (TDD) systems up to 45%.

The BGA7210 builds on the BGA7204 by adding flexible current setting across its two amplifiers, depending on the attenuation state. The serial peripheral interface is used to set the attenuation state, and, using a similar method, to set the current through the first and second amplifiers. The desired configuration is set by software and enables current savings of as much as 75 mA.

Higher output power, higher peak gain, and smaller attenuator step sizes enable engineers to use fewer components and provide greater control to maintain and optimize performance in the transmit chain.

Smart routing (with no connection crosses) reduces the number of board connections, simplifies design-in, and decreases the design footprint by 25%. The monolithic design increases reliability and ensures high quality.

2.1.3 Doherty amplifier technology for state-of-the-art wireless infrastructure

Best-in-class PA designs enable considerable energy savings

NXP's latest power amplifier designs let the wireless infrastructure run with significantly higher energy efficiency – towards “Green Base Stations”. In order to achieve the highest efficiencies currently possible, NXP combines its latest generations of LDMOS technology (Gen7 & 8) with the Doherty concept. The high performance of our LDMOS technology, matched with the efficiency of the Doherty technology, creates power amplifiers that offer high efficiency and high gain, are easily linearizable, and are more cost-effective to operate.

Developed by W.H. Doherty in 1936, the Doherty amplifier remained largely unused because the dominant mobile communication system modulation techniques (FM, GMSK, and EDGE) did not require high peak-to-average ratio (PAR) signals. For today's base stations, however, transmitting 3G, 4G, and multi-carrier signals makes the high power and added efficiency of the Doherty approach the preferred option for most service providers.

NXP's Doherty designs ensure high efficiency while maintaining a very similar peak power capability of two transistors combined. The input and output sections are internally matched, benefiting the amplifiers with high gain, good gain flatness, and phase linearity over a wide frequency band.

Integrated Doherty

NXP offers the world's first fully integrated Doherty designs. From the outside these devices look like ordinary transistors. In fact, they are completely integrated Doherty amplifiers that readily deliver the associated high efficiency levels for base station applications. With the ease of design-in of an ordinary Class AB transistor, they also provide significant space and cost savings.

Key features & benefits

- ▶ Contains splitter, main and peak amplifier, delay lines, and combiner in one package
 - 40% efficiency @ 10 W average power
 - No additional tuning in manufacturing
- ▶ Design is as easy as with a single Class AB transistor
- ▶ Ideally suited for space-constrained applications (e.g. remote radio heads, antenna arrays)
- ▶ Currently available for TD-SCDMA (BLD6G21L(S)-50) and W-CDMA (BLD22L(S)-50); see section 3.7.1.4 for details

Discrete Doherty amplifiers

In addition to the integrated versions, NXP offers product demonstrators for very efficient, high-power, discrete two- and three-way Doherty amplifiers. The two-way designs, based on the BLF7G22LS-130 device, deliver 47.0 dBm (50 W) with 43% efficiency and 15.7 dB gain for W-CDMA applications.

Our flagship three-way Doherty demonstrator achieves 48% efficiency at 48 dBm (63 W) average output power and 15.0 dB gain with a two-carrier W-CDMA signal. The current design covers the W-CDMA standard for band 1 operation and is tailored towards high-yield, minimum-tuning, volume manufacturing.

Key features & benefits

- ▶ Most efficient Doherty amplifier designs available to date
- ▶ Production-proven, consistent designs
- ▶ NXP's LDMOS provides unsurpassed ruggedness
- ▶ Currently available for the following frequency bands:
 - 728 to 821 MHz
 - 869 to 960 MHz
 - 1805 to 1880 MHz (DCS)
 - 1930 to 1990 MHz (PCS)
 - 1880 to 2025 MHz (TD-SCDMA)
 - 2110 to 2170 MHz (UMTS / LTE)
 - 2300 to 2400 MHz (WiBRO / LTE)
 - 2500 to 2700 MHz (WiMAX / LTE)
 - 3300 to 3800 MHz (WiMAX)

All of our product demonstrators are supported by comprehensive documentation and hardware. Please see section 3.7.1.8 for a complete list of available designs.

2.1.4 The new generation of LDMOS RF power for wireless infrastructures: NXP's Gen8

NXP announced last year the 8th generation of its renowned RF power device portfolio for base stations. Listening carefully to the world's leading infrastructure providers and understanding their requirements, we took a holistic approach to the development of Gen8. This means that we scrutinized every detail of a power transistor and reconsidered the entire "transistor system" to create a new generation that performs markedly better than its predecessors, and its competitors, and again sets standards for the industry.

Gen8 addresses the key trends in the wireless infrastructure industry

- ▶ Increasing signal bandwidths up to 100 MHz to enable full-band operation
- ▶ Cost sensitivity: peak powers up to 270 Watts in SOT502-sized packages
- ▶ Reduction in the size/weight/volume of the cabinet
- ▶ The ongoing need for greater electrical efficiency to reduce cooling requirements and operational expenditures
- ▶ Ever-increasing output power
- ▶ The need to deploy multi-standard and future-proof solutions

Gen8 is the answer to all these often conflicting requirements. The package and die design, as well as the input and output match structures, have been optimized to enable wideband, affordable, compact, multi-standard, and highly efficient Doherty power amplifiers. Solutions for all cellular frequency bands are currently being sampled and are in production or will be released throughout 2012.

The first wave of Gen8 transistors

Type	f_{\min} (MHz)	f_{\max} (MHz)	P1dB (W)	Matching	Package	Planned release	Description

Note: All devices are internally matched (I/O)

2.2 Broadband communication infrastructure

2.2.1 Connecting people, protecting your network: NXP's CATV C-family for the Chinese SARFT standard

Specially designed for the Chinese Hybrid Fiber Coax (HFC) infrastructure, NXP's CATV C-family offers a total solution for cable TV networks. It is both flexible enough for connecting rural communities as part of China's "Connecting to Every Village" program and powerful enough for upgrading major cities from analog to high-end digital services. All C-type devices are compliant with the Chinese State Administration for Radio, Film and Television (SARFT) standard, and cover most HFC applications in the 550 MHz to 1 GHz range.

Products

- ▶ BGY588C, BGE788C and CGY888C push-pull amplifiers
- ▶ BGD712C, CGD944C, CGD942C, CGD982HCi, CGD985HCi and CGD987HCi power doublers
- ▶ BGO807C, BGO807CE optical receivers

Benefits

- ▶ Compliant with Chinese SARFT HFC networks standard
- ▶ Transparent cap allows confirmation of product authenticity
- ▶ Rugged construction
- ▶ Highest by Design internal ESD protection

Features

- ▶ Excellent linearity, stability, and reliability
- ▶ High power gain
- ▶ Extremely low noise
- ▶ Silicon nitride passivity
- ▶ GaAs HFET dies for high-end devices

The BGY588C, BGE788C and BGD712C devices cover the frequency range from 550 MHz to 750 MHz. Extending the C-family portfolio into the high-end segment, the CGD944C, CGD942C, CGY888C and BGO807C operate between 40 and 870 MHz and have been specifically tested under Chinese raster conditions. Manufactured using our GaAs HFET die process, the CGD942C and CGD944C are high-gain, high-performance 870 MHz power doublers. The CGD982HCi, CGD985HCi and CGD987HCi operate from 40 to 1003 MHz and are specified for 870 MHz and 1 GHz. These power doublers are optimized for the Chinese SARFT standard. They are capable of satisfying the demanding requirements of top-end applications, including high-power optical nodes.

Our GaAs HFET MMIC dies are designed to provide the best ESD protection levels, without the external TVS components normally used with GaAs pHEMT devices.

All CATV C-type devices feature a transparent cap that makes it easy to distinguish them from counterfeit products.

Line-extender amplifier			•	•		•	•
Terminating amplifier	•	•	•				

BGY588C, BGE788C, and CGY888C

The last stage of an HFC network structure is called a 'terminating amplifier' or, since it's close to the subscriber, a "user amplifier." terminating amplifier requires a single module such as the BGY588C for 550 MHz, the BGE788C for 750 MHz and the CGY888C for 870 MHz systems. These modules fit perfectly in the Chinese "Connecting to Every Village" projects.

BGD712C

The BGD712C is a 750 MHz, 18 dB power doubler module. It has been designed for 750 MHz optical nodes including ordinary or optical receivers and distribution amplifiers. It can also be used in line-extender amplifiers together with a 750 MHz push-pull module, such as the BGY785A or the BGY787. As such it can be used widely in Chinese "Connecting to Every Village" projects.

CGD944C and CGD942C

Our full GaAs power doubler modules, the CGD942C and the CGD944C offer high output power and better CTB and CSO than other modules. Designed for high-end HFC networks containing optical nodes with multiple out-ports, these modules enable each port to directly cover at least 125 subscribers. These two devices are ideal when used in upgrading HFC networks to 870 MHz.

CGD982HCi, CGD985HCi, and CGD987HCi

Our newest GaAs power doubler modules, the CGD982HCi, the CGD985HCi and the CGD987HCi are customized designs for CATV hybrid fiber coax Chinese networks operating in the 40 to 1003 MHz bandwidth, and specified with the Chinese cable TV network official loading raster on top of the traditional NTSC loading rasters. For use in optical nodes for fiber deep applications where the output power level needs to be at its highest.

BGO807C

The BGO807C is an integrated optical receiver module that provides high output levels with integrated temperature-compensated circuitry. In an optical node design, the BGO807C enables a high performance / price ratio and ruggedness. When upgrading an HFC network from analog to digital, the BGO807C is the perfect fit.

Connecting people, protecting your network

2.2.2 Highly efficient line-up of 1 GHz GaAs modules for sustainable CATV networks

NXP high gain power doublers CGD104xHi and push-pulls CGY104

Designed for 1 GHz “sustainable networks,” these high-performance GaAs devices enable extended bandwidth and higher data rates. They deliver increased network capacity and make way for high-end services like HDTV, VoIP, and digital simulcasting.

New CATV GaAs platform layout

Key features

- ▶ Excellent linearity, stability, and reliability
- ▶ High power gain for power doublers
- ▶ Extremely low noise
- ▶ Dark Green products
- ▶ GaAs HFET dies for high-end applications
- ▶ Rugged construction
- ▶ Superior levels of ESD protection
- ▶ Integrated ringwave protection
- ▶ Design optimized for digital channel loading
- ▶ Temperature compensated gain response
- ▶ Optimized heat management
- ▶ Excellent temperature resistance

Key benefits

- ▶ Simple upgrade to 1-GHz capable networks
- ▶ Low total cost of ownership
- ▶ High power-stress capability
- ▶ Highly automated assembly

Key applications

- ▶ Hybrid Fiber Coax (HFC) applications
- ▶ Line extenders
- ▶ Trunk amplifiers
- ▶ Fiber deep-optical-node (N+0/1/2)
- ▶ Bridgers

The NXP power doublers CGD104xH and CGD104xHi are ideal for use in line extenders and trunk amplifiers. They support fiber deep-optical-node applications (N+0/1/2), delivering the highest output power on the market today. The GaAs HFET die process delivers high gain, excellent CTB and CSO ratings, and lower current.

The new NXP CGY104x push-pull family is the first line-up on the market to combine very low noise, best-in-class distortion parameters, and low, “carbon footprint” capabilities. It delivers the best performance for the lowest power consumption, so it reduces OPEX and CO₂ emissions

All of NXP’s 1 GHz solutions are designed for durability and offer superior ruggedness, an extended temperature range, high-power overstress capabilities, and extremely high ESD levels. As a result, they also reduce the cost of ownership.

The GaAs die is inserted in an HVQFN package that is then mounted on thermal vias that manage heat transfer to the heat sink. Temperature-control circuitry keeps the module’s high performance stable over a wide range of temperature. Assembly is fully automated and requires almost no human intervention, so repeatability remains very high.

Upcoming products

Additional push-pulls, currently under development, will extend the capabilities of the power doublers even further, supporting almost all modern HFC applications. The push-pull CGY1041 will deliver a gain of 21 dB, the CGY1043 a gain of 23 dB, the CGY1049 a gain of 29 dB and the CGY1032 a gain of

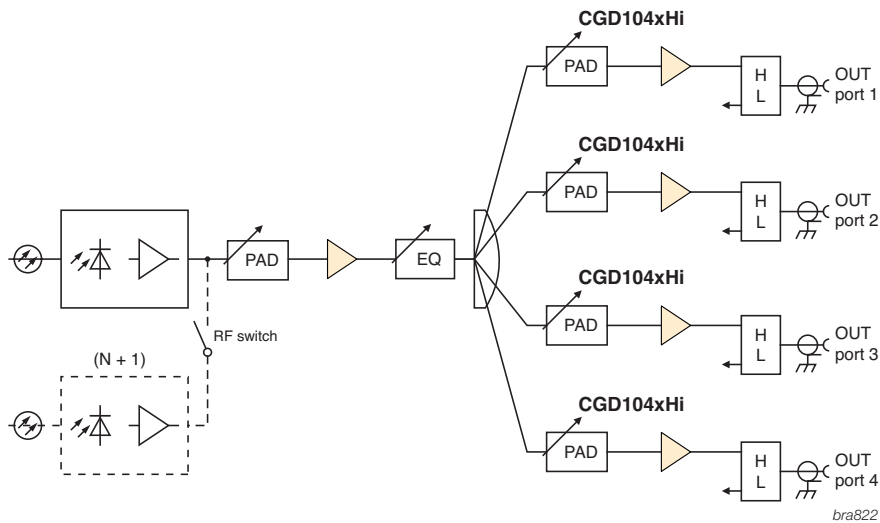

32 dB. NXP is also developing a new, highly integrated power doubler. The CGD1046Hi will deliver, in one IC, a 26 dB power gain with 60 dBmV output power and excellent ESD protection, for the ultimate in high-quality, distortionless devices.

2.3 TV and satellite

2.3.1 LNAs with programmable gain & bypass option for improved tuner performance

NXP LNAs BGU703x & BGU704x for TVs/STBs

Designed for high linearity and low noise, these 3.3 and 5 V wideband LNAs support multi-tuner applications in TVs, DVR/PVRs, and STBs operating between 40 MHz and 1 GHz. A unique programmable gain with bypass mode compensates for tuner switch signal loss (important in multi-tuner systems), and improves overall system performance by 7 to 10 dB.

Key features

- ▶ Internally biased
- ▶ Fixed $G_p = 10$ dB: BGU7031 (5 V), BGU7041 (3.3 V), and Fixed $G_p = 14$ dB: BGU7044 (3.3 V)
- ▶ Programmable between $G_p = 10$ dB and bypass: BGU7032 (5 V), BGU7042 (3.3 V), and programmable between $G_p = 14$ dB and bypass: BGU7045 (3.3 V)
- ▶ Programmable between $G_p = 10$ dB, 5 dB and bypass: BGU7033 (5 V)
- ▶ Flat gain between 40 MHz and 1 GHz
- ▶ Output power at 1 dB gain compression ($P_{L(1\text{ dB})}$) ranging from 9 to 14 dBm
- ▶ Noise figure as low as 2.8 dB
- ▶ High linearity with an OIP3 of 29 dBm
- ▶ 75 Ω input and output impedance
- ▶ Power-down during bypass mode
- ▶ ESD protection >2 kV HBM, >1.5 kV CDM on all pins

Key trends

- ▶ Multiple tuners in TV, DVR/PVR, and set-top box applications, requiring improved signal handling
- ▶ Use of 3.3 V Si tuner ICs, perfect match with our 3.3 V LNAs (BGU704x)

Applications

- ▶ Terrestrial and cable set-top boxes (STBs)
- ▶ Silicon and can tuners
- ▶ Personal and digital video recorders (PVRs and DVRs)
- ▶ Home networking and in-house signal distribution

NXP's BGU703x and BGU704x low-noise amplifiers (LNAs) upgrade overall picture quality with improved signal handling (NF, dynamic range), while reducing the number of external components.

Produced in NXP's own QUBiC4+ Si BiCMOS process, they improve signal handling by compensating for the signal loss at the tuner switch. This can improve system performance by as much as 7 to 10 dB.

The BGU7031, BGU7041, and BGU7044 are LNAs with fixed gain. The BGU7032, BGU7042, and BGU7045 have an additional bypass mode, and the BGU7033 adds two gain levels along with the bypass mode. In bypass mode, the devices consume less than 5 mA of current. Integrated biasing and 75 Ω matching reduces footprint by eliminating as many as 15 components compared to discrete solutions.

All the devices can be used with discrete or Si can tuners, as well as with on-board tuners. They deliver more robust ESD performance compared to GaAs solutions, withstanding >2 kV human body model (HBM) and >1.5 kV charged device model (CDM).

BGU703x evaluation board

Focus applications, products & technologies

Block diagram

Application diagram of an active splitter with passive loop-through

2.3.2 Complete satellite portfolio for all LNB architectures

NXP Satellite LNB devices TFF101xHN, BFU710F/730F, and BGA28xx

Designed for use in LNAs, mixers, and IF amplifiers, these robust, small-footprint products are the latest additions to NXP's leading portfolio for satellite LNB architectures. They are manufactured in NXP's groundbreaking QUBiC4X SiGe:C and QUBiC4+ process technologies.

Fully integrated Ku-band downconverters TFF101xHN

The TFF101xHN is a family of fully integrated downconverters for Ku-band LNBs. They give the best RF performance in terms of phase noise, gain, and noise figure at the lowest current consumption in the market.

Ku-band downconverter TFF101xHN/N1 for LNB

- ▶ Typical application: Universal single LNB & twin LNB
- ▶ Ultra-low current consumption: 52 mA over PVT
- ▶ Only 7 external components
- ▶ No inductors
- ▶ Single supply domain: 5 V
- ▶ Uses low-cost fundamental 25 MHz crystal
- ▶ High PL1dB_o = 6 dBm / 3OIP_o = 16 dBm
- ▶ Best-in-class PN < 1.4 deg RMS
 - 10 kHz to 13 MHz integration bandwidth
- ▶ Multiple gain types available
 - TFF1014HN/N1 36 dB
 - TFF1015HN/N1 39 dB
 - TFF1017HN/N1 42 dB
 - TFF1018HN/N1 45 dB
- ▶ Flat gain over frequency (< 2 dBpp)
- ▶ Input & output matched 50 Ω
- ▶ Small leadless DHVQFN16 package (2.5 x 3.5 x 0.85 mm)

RF transistors BFU710F/730F

The BFU710F and BFU730F are wideband RF transistors that can be used as an LNA or as a mixer for a DBS LNB in the Ku-band. In either application, they deliver good noise and linearity, a higher gain at a lower current consumption compared to their GaAs pHEMT equivalents, and the cost advantage of silicon.

BFU710F as LNA in Ku-band LNB

- ▶ Typical application: LNA2 for single-output LNB
- ▶ Overall similar RF performance to GaAs pHEMT LNAs
- ▶ Power consumption: 3.5 mA
- ▶ Single supply: 3/5/6 V
- ▶ High RF gain: 13.5 dB
- ▶ Low noise figure: 1.6 dB
- ▶ Linearity (OIP3): 12 dBm

BFU710F as mixer in Ku-band LNB

- ▶ Typical application: Active mixer for single-output LNB
- ▶ Single supply 3/5/6 V
- ▶ Low power consumption: 2.5 mA
- ▶ LO drive < 0 dBm
- ▶ SSB noise figure < 8 dB (including BPF at the input)
- ▶ SSB conversion gain > 5 dB (including BPF at the input)
- ▶ Linearity (OIP3) > 0 dBm
- ▶ LO-RF isolation min 20 dB
- ▶ RF match better than 10 dB
- ▶ IF match better than 8 dB

BFU730F as LNA in Ku-band LNB

- ▶ Typical application: LNA2 and LNA3 for multi-output LNB
- ▶ Overall similar RF performance to GaAs pHEMT LNAs
- ▶ Power consumption: 11 mA
- ▶ Single supply 3/5/6 V
- ▶ Very high RF gain: 11.5 dB
- ▶ Low noise figure: 1.25 dB
- ▶ Linearity (OIP3) > 17 dBm
- ▶ Return loss > 10 dB

MMICs BGA28xx as IF amplifiers (first stage & output stage)

For compatibility with existing designs, the series uses market standard packages: the SOT363 and the pin-compliant SOT363F. The pinning is identical to NXP's current gain block family, and the blocks deliver similar noise figures. New features include flatter gain, a positive gain slope, improved P1dB vs I_{cc}, and no necessity for an output inductor.

- ▶ Internally matched at 50 Ω
- ▶ Gain slope > 0.5 dB

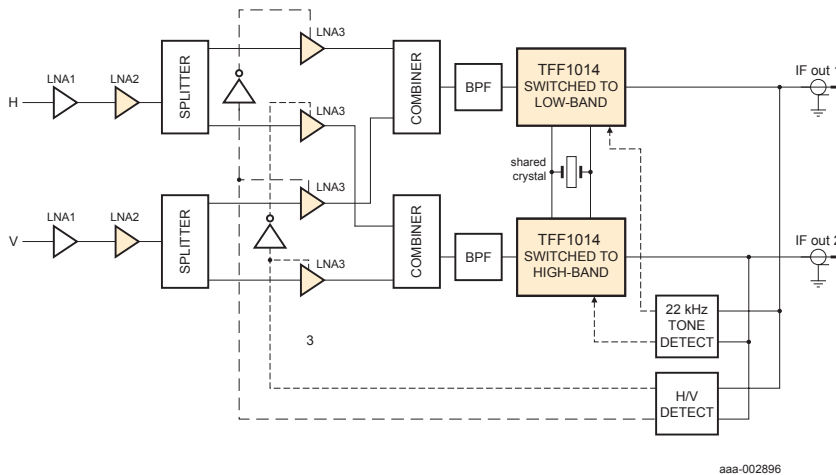

- ▶ Single supply voltage: 3.3 or 5 V
- ▶ Reverse isolation: > 30 dB up to 2 GHz
- ▶ Best-in-class power vs current consumption
- ▶ Noise figure: 4 to 6 dB at 1 GHz
- ▶ Unconditionally stable ($K > 1$)
- ▶ High-compression-point models work without output inductor
- ▶ 6-pin SOT363 plastic SMD package

These products – the integrated downconverters TFF101xHN, the wideband transistors BFU710F/730F for LNA and mixer functionality, and the BGA28xx series of IF MMICs – are

the most recent additions to NXP's leading portfolio for satellite LNB. They join the other discrete products, including oscillators, amplifiers, and switches, to provide complete coverage for all LNB architectures.

Since the ICs, transistors, and the MMICs are manufactured in NXP's industry-leading QUBiC4X SiGe:C and QUBiC4+ process, they offer better overall RF performance and are more robust than their GaAs equivalents and offer the added cost advantage of silicon. The process technology also enables higher integration, for added features. NXP owns the industrial base for production (wafer fab, test, assembly), so volume supplies can be assured.

Satellite outdoor unit, twin low noise block (LNB) with integrated mixer/ oscillator/ downconverter

Note: Also see section 1.3.4 Satellite outdoor unit, twin low noise block (LNB) with integrated mixer/ oscillator/ downconverter

Fully integrated mixer/oscillator/downconverter

2.3.3 VSAT, 2-way communication via satellite

Design a Ku-/ Ka-band VSAT transceiver that meets IESS-308 with NXP's Ku-/ Ka-band RF LO generators

The TFF100xHN family are Ku-band RF PLLs, with integrated VCO intended for low phase-noise local-oscillator (LO) circuits in Ku- & Ka-band VSAT transmitters and transceivers. Manufactured in a high-performance SiGe:C process, these devices deliver extremely low phase noise and comply with the IESS-308 from Intelsat.

Features

- ▶ Phase noise compliant with IESS-308 (Intelsat)
- ▶ Differential input and output
- ▶ Divider settings at 16, 32, 64, 128, or 256
- ▶ Lock-detect output
- ▶ SiGe:C technology (120 GHz f_T process)
- ▶ HVQFN24 (SOT616-1) package

Applications

- ▶ VSAT block upconverters
- ▶ VSAT down conversion
- ▶ Local oscillator signal generation

VSAT networks are commonly used to transmit narrowband data, such as point-of-sale transactions for credit cards, or to transmit broadband data that supports satellite Internet access to a remote location, VoIP, or video.

The network typically consists of a dish antenna, an outdoor unit, and an indoor unit. The outdoor unit is used for frequency translation between RF and IF, and usually includes a microwave-based uplink/downlink separator, a low noise block (LNB) for receiving the downlink signals, and a block Upconverter (BUC).

The VSAT ICs can be used to create the LO generator for a linear BUC (meaning the IF or RF conversion is done by mixing with an LO).

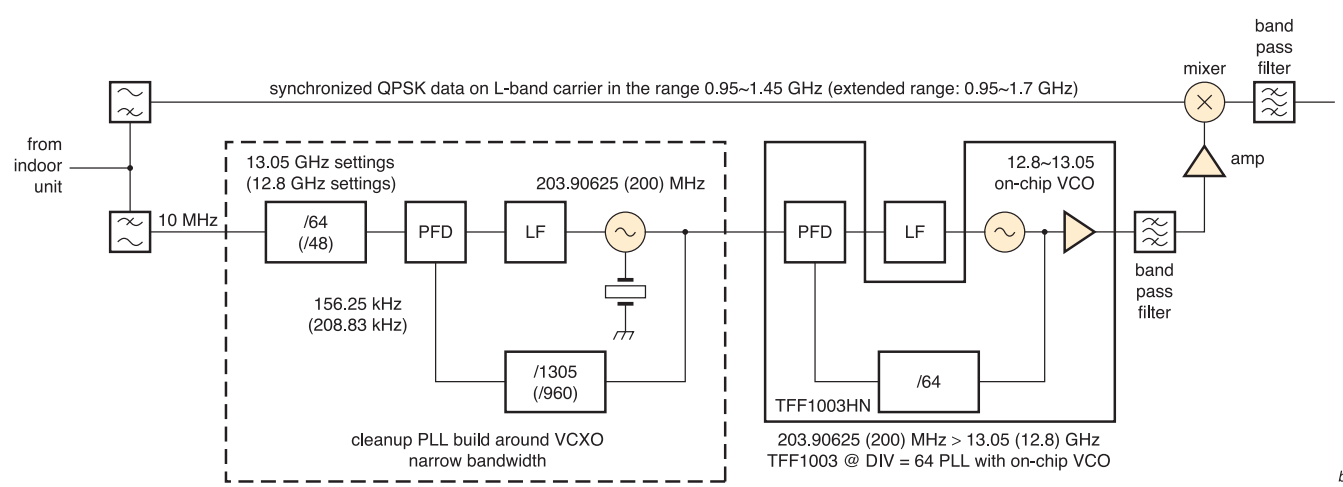

To enable precise frequency and time multiplexing, the downlink signal provides an accurate frequency reference of 10 MHz. The indoor unit frequency multiplexes this with the uplink IF signal, and the LO signal in the BUC needs to be frequency-locked to the reference.

The TFF100xHN ICs are housed in a 24-pin HVQFN (SOT616-1) package. The pins have been assigned for optimal performance. Three voltage domains are used to separate the block on the IC, and two pins for each output (OUT-P and OUT-N) have been reserved to match a typical layout using a linewidth of $Z = 50 \Omega$ microstrip on a 20-mil RO4003 board (1.1 mm).

The ground pins have been placed next to the reference input and the output, and, to minimize crossings in the application, all the supply pins are on the same side of the IC.

Typical VSAT network

brb200

2.3.4 Low noise LO generators for microwave & mmWave radios

NXP LO generators (integrated VCO/PLL) TFF11xxxHN

Manufactured in NXP's breakthrough QUBiC4X SiGe:C process technology, these highly integrated, alignment-free LO generators are low-power and low-spurious solutions that simplify design-in and lower the total cost of ownership.

Features

- ▶ TFF11xxxHN family: lowest-noise LO generators for a full family in 7 to 15 GHz range
- ▶ Maximum power consumption for all types is 330 mW (typ)
- ▶ Phase-noise compliant with IESS-308 (Intelsat)
- ▶ Proven QUBiC4X SiGe:C technology (120 GHz f_r process)
- ▶ External loop filter
- ▶ Differential input and output
- ▶ Lock-detect output
- ▶ Internally stabilized voltage reference for loop filter
- ▶ 24-pin HVQFN (SOT616-1) package

Applications: TFF11xxxHN family

- ▶ Industrial/medical test and measurement equipment
- ▶ Electronic warfare (EW)
- ▶ Electronic countermeasures (ECM)
- ▶ Point-to-point
- ▶ Point-to-multipoint
- ▶ Satellite communication/VSAT
- ▶ Radar systems

These low noise local-oscillator (LO) generators, optimized for use in many different microwave applications between 7 and 15 GHz, deliver highly accurate performance in a small footprint. They require no alignment or frequency modification on the production line, so they simplify manufacturing. High integration saves board space and makes design-in easier, for lower overall cost and faster development.

Since these ICs are manufactured in NXP's industry-leading QUBiC4X SiGe:C process, they offer better overall RF performance, are more robust than their GaAs equivalents, and consume much less power. The process technology also enables higher integration, for added features. NXP owns the industrial base for production (wafer fab, test, assembly), so volume supplies can be assured.

The TFF1003HN is the basis for the entire family of LO generators. It has VCO coverage of 12.8 to 13.05 GHz and accepts input signals from 50 to 816 MHz. The divider can be set for 16, 32, 64, 128, or 256, and the output level is -5 dBm with a stability of ± 2 dB. The family of LO generators is completed by a range of 18 different devices operating in a center frequency ranging from 7 to 15 GHz. The RF performance of all these devices is consistent with the TFF1003HN.

All the LO generators have low power dissipation (330 mW typ), and all are available in a space-saving 24-pin HVQFN package.

Full portfolio overview of low noise LO generators for general microwave applications in section 3.4.4

2.4 Portable devices

2.4.1 The best reception of GNSS signals with the smallest footprint

NXP SiGe:C GPS LNAs BGU700x/BGU8007

NXP's GPS low-noise amplifiers offer the best reception of weak signals because of dynamic suppression of strong cellular and WLAN transmit signals. Moreover, as only two external components are required, designers can save up to 50% in PCB size and 10% in component cost.

Key features

- ▶ Low noise figure: 0.75 dB
- ▶ System-optimized gain of 16.5 or 19 dB
- ▶ Adaptive biasing dynamically suppresses strong cellular and WLAN transmit signals, resulting in improved linearity of 10 dB better IP3 under -40 to -20 dBm jamming conditions and effective GPS output with jammer powers up to -15 dBm
- ▶ AEC-Q100 qualified (BGU7004, BGU7008) for highest reliability in harsh conditions
- ▶ Only two external components required
- ▶ Small 6-pin leadless package: 1.45 x 1.0 x 0.5 mm

Key benefits

- ▶ Maintains optimal GPS signal reception for as long as possible
- ▶ Significant PCB size savings (50%)
- ▶ Lower component cost (10%)

Applications

- ▶ Smart phones, feature phones
- ▶ Tablets
- ▶ Personal Navigation Devices (PNDs)
- ▶ Digital Still Camera (DSCs)
- ▶ Digital Video Camera (DVCs)
- ▶ RF front-end modules (used in phones)
- ▶ Complete GPS chipset modules (used in DSCs)
- ▶ Automotive applications (BGU7004/8): toll collection, emergency call

These SiGe:C low-noise amplifiers (LNAs) improve the reception of GPS signals, including GloNass and Galileo. Available in extremely small 6-pin packages, they reduce footprint, lower cost, and enhance reception in systems that use an active or patch antenna.

GPS has become a standard feature in a very wide range of consumer products, from personal navigation devices to digital video cameras, watches, electric cars, and more. GPS signal power levels are weak and below the noise floor at -155 dBm. In many of these products, especially smart phones, strong transmitters such as WLAN and cellular can drive the GPS LNA into compression. When the GPS LNA is in compression, it has lower gain, and that can worsen GPS reception. Also, when the LNA is in compression, it generates intermodulation products and harmonics from the transmitter signals, which can overpower the weak GPS signals and lead to no GPS reception.

The NXP BGU700x/BGU8007 series use adaptive biasing to immediately detect any output power from jammers, and compensate by temporarily increasing the current. As a result, optimal GPS signal reception is maintained for as long as possible.

Each device in the BGU700x/BGU8007 series requires only one input matching inductor and one supply decoupling capacitor to complete the design. This creates a very compact design and lowers the bill of materials. Designers can save up to 50% in PCB size and 10% in component cost. For example, the BGU7005 is in a 1.45 x 1 mm package with application area at only 4.53 mm². This is 50% smaller than a comparable solution with a 9.06 mm² application area.

Application diagram

Smallest footprint

2.5 Industrial, scientific & medical

2.5.1 Medical applications driven by RF power: From imaging to cancer treatment, a flexible and versatile technology in the doctor's toolbox

RF technology is making its way into all kinds of medical applications, ranging from the well-known imaging techniques (MRI, EPRI) over low frequency, external heat treatment, and electro-surgical tools, to minimally invasive endoscopic cancer treatment (RF ablation). One clear trend is the increasing share of RF-based technologies for ablation. Another is the trend towards higher RF frequencies (several GHz) and higher powers (> 100 W) in order to achieve higher spatial resolution, better control, and shorter treatment times.

RF radiation is not a new technology in medicine. It is currently used for imaging purposes in MRI (magnetic resonance imaging) and EPRI (electron paramagnetic resonance imaging), techniques that employ frequencies from a few megahertz to about 500 MHz. Other well-known external heat-treatments to rejuvenate skin or relieve muscle pain make use of frequencies around 480 kHz – not too demanding in terms of RF. Surgical equipment to cut and simultaneously coagulate blood vessels runs off RF at about 5 MHz. The latter application belongs to a class of treatment techniques that is growing rapidly and uses RF radiation to deposit energy locally at various parts of the body – in general to “ablate” (remove) unwanted tissue. Inside the body, the RF energy heats the surrounding tissue until it is desiccated and/or necrotized. The damaged tissue will later be re-absorbed by the surrounding, living tissue. Further application examples for RF ablation include cancer treatment in the lung, kidney, breast, bone and liver, removal of varicose veins, treatment of heart arrhythmia, and a growing list of other applications that benefit from the high control and feedback possible with RF.

Another advantage of RF in this context is the fact that it can be applied via small catheters ending in antennas that deploy the RF signal. Unlike older, direct-current techniques, the tissue is heated only very locally around the antenna. Neighboring nerves (and the heart) are not stimulated. This led to the development of a variety of specialized catheters, used during minimally invasive surgery, along with ultrasound or X-ray imaging to determine the exact location of the RF-active part. During the treatment, the impedance of the surrounding tissue can be monitored and the end-point determined. With proper catheters, one can even achieve “self limitation” due to the reduced uptake of RF energy in desiccated tissue. Likewise, the RF frequency can be used to tune the energy deposition zone around the catheter: the higher the frequency, the smaller the penetration depth – and hence the volume to deposit the RF energy – in the watery tissue.

With the trend towards higher RF frequencies and powers, the complexity of RF generators and the requirements for the device technology also increase. Above 10 MHz, say, up to 3.8 GHz, the technology of choice for power amplifiers is Si LDMOS (laterally

diffused metal oxide semiconductor). This technology has proven to be powerful, efficient, and rugged in base stations, radar systems, broadcast transmitters, and other industrial, scientific, and medical (ISM) applications. LDMOS is available from up to 50 V supply to achieve power levels up to 1,200 W per single device, with outstanding ruggedness and high gain and efficiency. To drive and control the LDMOS power amplifier stages, it takes voltage-controlled oscillators, phase locked loops, and medium power amplifiers. These parts of the RF signal chain are conveniently available based on reliable and high-volume SiGe:C (QUBiC) semiconductor technologies. Going a step further, one can even use high-speed converters to drive the signal chain entirely from the digital domain, for full and easy control over the shape and modulation of the applied RF.

RF implications

These in-situ medical applications and, in general, most of the ISM applications, usually form highly mismatched RF loads during some part of the usage cycle. This in turn means that, without protection or other measures, all of the “injected” RF power reflects back into the final stage of the amplifier and needs to be dissipated in the transistor(s), and most likely destroys the device(s) if this situation lasts too long. LDMOS transistors are designed to be extremely rugged and generally withstand these mismatch situations without degrading over time.

This device ruggedness, or the ability to withstand “harsh” RF conditions in general, be it mismatch or extremely short pulse rise and fall times, is essential for reliable device performance. RF power companies have gone to great lengths to achieve best-in-class device ruggedness. The technologies have been hardened under the most stringent ruggedness tests during development, which is particularly true for the 50 V technology. Among other factors, the base resistance of the parasitic bipolar and the drain extension of the LDMOS device play key roles in this respect.

This ruggedness, combined with the power density and the high efficiencies achievable, make LDMOS the preferred technology for RF power amplifiers up to 3.8 GHz.

2.5.2 RF-driven plasma lighting:

The next revolution in light sources are powered by solid-state RF technology

Recent developments in RF power technology, such as improved cost structure, ruggedness, and power levels of up to 1200 W per device, have enabled a breakthrough light source technology, called 'RF plasma lighting'. All RF plasma lighting sources make use of a small, electrode-less quartz lightbulb that contains argon gas and metal halide mixtures. The bulb is powered by direct RF radiation, which ignites the gas mixtures to create and power a bright plasma, the color of which can be tuned by the composition of its constituents.

This technology works without any additional electrodes in the bulb, unlike standard high-intensity discharge lamps. No electrodes means very long operating lifetimes, since the contamination and wire erosion that lead to decreased efficiency and eventual lamp failure are precluded. The RF light source lives up to 50,000 hrs when it reaches 50% of its original light output. Typical high-intensity discharge lamps, by comparison, achieve 20,000 hrs operating life. Another strong point of the plasma light is its efficiency: 1 W of RF power is converted to 130-140 lm of light. This leads to very compact, very bright lamps that easily emit 10,000 to 20,000 lm of white light with a close-to-sunlight color rendition.

The key enabler for the RF light source is RF technology, based on Si LDMOS RF power transistors. LDMOS technology operating at 28 V is the leading RF power technology for cellular base stations or broadcast transmitters as final amplifier stages in the frequency range between a few MHz up to 3.8 GHz. Recently, another LDMOS format, 50 V LDMOS, has emerged for use in broadcast, ISM, defense and avionics applications. It combines high power density to achieve power levels up to 1,200 W per single device and outstanding ruggedness, with high gain and efficiency at frequencies of up to 1.5 GHz.

Comparison of lighting technologies

The table below summarizes currently available technologies that generate bright light with varying degrees of efficiency. It lists a few key parameters, including lifetime, luminous flux, efficacy, color rendition index, color temperature, start-up time, and re-strike time (time to start after switch-off from normal operation).

Type	Lifetime (hrs)	Luminous flux (klm)	Efficacy (lm/W)	Color rendering	Color temperature (K)	Start-up time (s)	Re-strike time (s)
Incandescent	2,000	1,700	10 to 17	100	3200	0.1	0.1
Fluorescent	10,500	3,000	115	51 to 76	2940 to 6430	0.3	0.1
LED	25,000	130	60 to 100	30	6000	0.1	0.1
HID (high-intensity discharge)	20,000	25,000	65 to 115	40 to 94	4000 to 5400	60	480
RF plasma	50,000	25,000	100 to 140	70 to 94	4000 to 5500	30	25

Table 1: Comparison of light generation. Note: numbers are only valid for a qualitative comparison. Source: www.wikipedia.org and references therein.

The plasma light source is among the brightest and most efficient available to date and boasts a very long life time. Important to note is the high brightness per bulb: much brighter than LEDs, for example. Consequently, it takes multiple LEDs to generate the light output of a single plasma light source. Hence, LED luminaries for street lighting will be considerably larger than those for plasma light sources.

RF implications

The RF plasma lighting sources can operate at a wide range of RF frequencies, but initial applications typically focus at frequencies of around a few hundred megahertz. At these frequencies both the 28 and 50 V LDMOS technologies can be used, yielding high efficiency values of 70% to more than 80% and low-heat dissipation making compact plasma lamp designs possible.

The RF-driven plasma light is a perfect example of novel applications that can be powered by RF energy in the industrial, scientific, and medical (ISM) realm. Established technologies use RF to pump a gas discharge in a laser cavity. These "gas discharge" applications and, in general, most of the ISM applications, typically form highly mismatched RF loads during some part of the usage cycle. In the case of gas discharges, for example, the gas cavity acts as an "open circuit" during switch-on. This in turn means that without protection or other measures, all of the "injected" RF power reflected back into the final stage of the amplifier needs to be dissipated in the transistor(s) right there and most likely destroys the device(s) if this situation lasts too long. After the discharge strikes, the load impedance reverts to "matched," eventually, and the transistor sees an acceptable load. Obviously, these mismatched conditions occur every time the plasma is "switched on," exerting strain on the finals. LDMOS transistors are designed to be extremely rugged and generally withstand these mismatch situations without degrading over time.

This ruggedness, combined with the high power density and efficiency achievable, make LDMOS the preferred technology for RF lighting and other equally demanding applications in the ISM realm.

2.5.3 QUBiC4 Si and SiGe:C transistors for any RF function

NXP wideband transistors BFU6x0F & BFU7x0F

These next-generation devices offer the best RF noise figure versus gain performance, drawing the lowest current. This performance allows for better signal reception at low power and enables RF receivers to operate more robustly in noisy environments.

Key features

- ▶ 40/110 GHz transition frequency allows for applications up to 18 GHz and beyond
- ▶ High gain of 13.5 dB at 12 GHz with a low noise figure of 1.45 dB
- ▶ High linearity of 34 dBm (OIP3) at 1.8 GHz
- ▶ Consuming only 3 mA to generate 13.5 dB gain at 12 GHz
- ▶ Plastic surface-mount SOT343F package for high performance and easy manufacturing

Applications

- ▶ Wideband applications that require
 - Low-noise amplifiers
 - High linearity and high output amplifiers
 - Buffer amplifiers
 - Mixers
 - Oscillators

The devices in this family of sixth- (Si) and seventh- (SiGe:C) generation RF transistors can be used to perform nearly any RF function. For example, the BFUx10F, BFUx30F, BFU725/N1

can be used as low-noise amplifiers, while the BFUx60F and BFUx90F can be used as high-linearity and high-output amplifiers. Other options include using these transistors as buffer amplifiers, mixers, and oscillators.

Higher transition frequencies (40 to 110 GHz) enable higher application frequencies (24/77 GHz car radar, 18 GHz Ka band, 3.5-3.7 WiMas, etc.), and the devices meet the low current requirements of wideband applications.

As a result, these devices are ideal for use in a very wide range of applications: second and third LNA stage and mixer stage in DBS LNBs, Ka/Ku band DROs, satellite radio (SDARS) LNA, C-band/X-band high-output buffer amplifiers, AMR, WLAN/WiFi, ZigBee, Bluetooth, FM radio, GPS, cellular (LTE, UMTS), mobile TV, RKE, high-linearity applications, low current battery-equipped applications, low-noise amplifiers for microwave communications systems, medium output power applications, microwave driver/buffer applications, and more.

2.5.4 Building on decades of innovation in microwave and radar

NXP builds on more than 50 years of history in semiconductor technology and component design. For more than three decades we have led in providing high-performance RF technologies for microwave applications. The company has built a strong position in the field of RF small-signal and power transistors for microwave amplifiers with best-in-class Si devices and processing technologies.

We were the first semiconductor company to supply S-band transistors (2700 to 3500 MHz) based on laterally diffused metal-oxide-silicon (LDMOS). To further strengthen our position towards the future, we are currently developing new high-power and high-bandwidth technologies based on gallium nitride (GaN) material.

Another enabling technology is NXP's BICMOS process QUBiC, which is available in several variants with f_T up to 200 GHz, each specialized to address specific small-signal RF applications.

The product portfolio encompasses:

- Low-noise amplifiers (LNAs)
- Variable-gain amplifiers (VGAs)
- Mixers
- Local oscillators (LOs)
- LO generators

NXP now also focuses on architectural breakthroughs and has developed highly integrated products for microwave and millimeter wave. One example is a family of LO generators from 7 to 15 GHz with integrated PLL and VCO. Another example is an integrated RF power module in S-band (3.1-3.5 GHz) at 200 W.

RF small-signal product highlight

Manufactured in NXP's breakthrough QUBiC4X SiGe:C process technology, these highly integrated, alignment-free LO generators TFF1xxxHN are low-power, low-spurious solutions that simplify design-in and lower the total cost of ownership.

Features

- ▶ Lowest noise LO generators for 7 to 15 GHz range
- ▶ Maximum power consumption for all types, typical 330 mW
- ▶ Phase-noise compliant with IESS-308 (Intelsat)
- ▶ Proven QUBiC4X SiGe:C technology (120 GHz f_T process)
- ▶ External loop filter
- ▶ Differential input and output
- ▶ Lock-detect output
- ▶ Internally stabilized voltage reference for loop filter

RF power product highlight

The BLS6G2933P-200 is the first LDMOS-based, industry-standard pallet produced by NXP. This pallet offers more than 40% efficiency and includes the complete bias network for S-band applications.

Features

- ▶ Reduces component count and considerably simplifies radar system design
- ▶ P1 dB output power 200 W
- ▶ Efficiency > 40%
- ▶ Industry-standard footprint
- ▶ 50 Ω in/out matched for entire bandwidth
- ▶ Lightweight heat sink included
- ▶ The advantages of LDMOS over Bipolar
 - Higher gain and better efficiency
 - Better ruggedness – overdrive without risk to 5 dB
 - Improved pulse droop and insertion phase
 - Consistent performance – no tuning required
 - Improved thermal characteristics – no thermal runaway
 - Non-toxic packaging and RoHS-compliance

Microwave applications and bands of operation

System	Frequency
VHF and UHF	<1 GHz
L-band	1200 - 1400 MHz
S-band	2700 - 3500 MHz
X-band	8000 - 12000 MHz
Commercial avionics	
DME (Distance Measuring Equipment) Transponders	978 - 1215 MHz
Mode A / Mode S / Mode C / TCAS	1030 - 1090 MHz
Military avionics	
IFF transponders (Identification, Friend or Foe)	1030 - 1090 MHz
TACAN (Tactical Air Navigation)	960 - 1215 MHz
JTIDS / MIDS (Joint Tactical Information Distribution System)	960 - 1215 MHz
Marine radar	9300 - 9500 MHz

For a complete list of products, see the respective small-signal and power microwave pages in chapter 3

2.5.5 Digital broadcasting at its best

The BLF881 / BLF888A transistor line-up enables today's most powerful and efficient digital broadcast transmitter applications

BLF881

This transistor is based on NXP's 50 V LDMOS technology and features 120 W RF output power for broadcast transmitter and industrial applications. An unmatched device, the BLF881 can be used in the HF to 1 GHz range. The excellent ruggedness and broadband performance of this device make it ideal for digital transmitter applications – either on its own or as a driver in combination with the high-power transistor BLF888A.

The BLF881 is also available in an earless version, the BLF881S, which enables an even more compact PCB design.

BLF888A

Running from a 50 V supply voltage, the BLF888A is a 600 W LDMOS RF power transistor for broadcast transmitter and industrial applications. Being a matched device, the BLF888A is optimized for digital signal broadcasting and can deliver 120 W average DVB-T output power over the full UHF band from 470 MHz to 860 MHz with 20 dB power gain and 31% drain efficiency. The excellent ruggedness of this transistor (it withstands a VSWR in excess of 40:1) makes it the ultimate choice as final stage for digital transmitter applications – ideally accompanied by a BLF881 as the driver. This device is also available in an earless package, denoted BLF888AS, to enable surface-mount assembly processes and take optimum advantage of the very low thermal resistance of the package.

Key features and benefits

- ▶ Excellent efficiency and reliability
- ▶ Highest power levels in the market
- ▶ Best-in-class ruggedness designed into all devices
- ▶ Best broadband performance
- ▶ Easy power control
- ▶ Best-in-class design support
- ▶ Low thermal resistance design for unrivalled reliability
- ▶ Advanced flange material for optimum thermal behavior and reliability
- ▶ Designed for broadband operation (470 to 860 MHz)

Key applications

- ▶ Analog and digital TV transmitters

2.5.6 Setting the benchmark for ultra low-power and high-performance wireless connectivity solutions

NXP's JN5148/2 wireless microcontroller platform with chipsets, modules, and supporting software

NXP provides a complete package for the development of IEEE802.15.4-based wireless network solutions, incorporating all the necessary hardware and software components. NXP's JN514x range of wireless microcontroller chips provides the optimum hardware platform for designing wireless network nodes that combine high-performance processing and radio communications. NXP also supplies JN514x wireless microcontrollers mounted on modules, and evaluation kits that simplify the development of custom applications.

Products

- ▶ JN5142-J01 for JenNet-IP Smart Devices, JN5148-J01 for JenNet-IP Gateways
- ▶ JN5148-001 for JenNet and IEEE802.15.4, JN5142-001 for RF4CE and IEEE802.15.4
- ▶ JN5148-Z01 for ZigBee applications
- ▶ JN5148-001-M00, JN5148-001-M03, JN5148-001-M04: modules for JenNet and IEEE802.15.4

Key features

- ▶ Ultra low-power MCU together with an IEEE802.15.4-compliant radio transceiver
- ▶ Enhanced 32-bit RISC processor for high performance and low power
- ▶ On-chip ROM and RAM for storage of application, networking stack, and software libraries
- ▶ A rich mix of analog and digital peripherals
- ▶ Low-current solution for long battery-life
- ▶ Standard-power and high-power modules
- ▶ Software Developer's Kit (SDK), including JenNet, JenNet-IP and ZigBee networking stacks

Key applications

- ▶ Smart lighting / smart energy / smart grid
- ▶ Utilities metering
- ▶ Home and commercial building automation and control
- ▶ Remote control
- ▶ Security systems
- ▶ Location-aware services – eg asset management

Software

A selection of network protocol stacks, based on the industry-standard IEEE802.15.4, is available to support the wireless connectivity requirements of your application. These include JenNet, JenNet-IP, and ZigBee PRO, which are provided as a set of software libraries.

JenNet is suitable for all proprietary applications. ZigBee PRO is used for smart energy and other applications where ZigBee interoperability is required. JenNet-IP provides IPv6 connectivity to the end node and is rapidly emerging as a standard for lighting and automation applications in buildings.

Evaluation kit

2.6 Technology

2.6.1 The first mainstream semiconductor company to offer GaN products

NXP Gallium-Nitride (GaN) broadband amplifiers

A disruptive technology, setting new performance boundaries for RF power amplifiers

If independent market research claims come true, GaN product sales will exceed 300 Musd in 2014. This can only happen if GaN is made available through mainstream semiconductor companies, and NXP is the first to make this happen. So, what is it about GaN and RF power applications? Simply put, GaN makes a step increase in efficiency and power density performance over Si LDMOS in most applications. This can be quantified in the Johnson's Figure of Merit (FoM) – a combination of significant RF performance variables that has a baseline for Si at 1 and leads to a FoM for GaN of 324. To put this into some context, GaAs, another commonly used compound material in RF, has a FoM of 1.44. With such a high FoM rating, GaN truly represents a breakthrough technology.

GaN products are termed High-Electron Mobility Transistors (HEMT), a name that captures one of the intrinsic benefits of GaN: the high electron drift velocity. These transistors are depletion-mode devices, that is, devices that are normally on, without the need for applying a gate bias. A negative gate bias will be needed to switch the transistors off. This biasing is not straightforward, but at NXP, we've developed complete solutions (not just individual components) that include a tried and tested bias circuit. We also provide continuous application support throughout the life of the product.

A further advantage of GaN is that it is a very hard structure able to withstand very high temperatures. NXP's GaN transistors will be specified to a maximum temperature of 250 °C, compared to 225 °C for Si LDMOS. Special packages are required to support such high temperatures. In this area, NXP's GaN customers benefit from our 30-year legacy in RF power products, and our large industrial base. As a GaN supplier, we deliver excellence

in product reliability and cost, and give our customers a high degree of confidence in the supply chain. It's part of what's needed to take GaN to the mainstream.

The first NXP GaN products will be unmatched broadband amplifiers for use in applications requiring high RF performance across a wide range of frequencies up to 3.5 GHz. NXP's first generation GaN process is designed for products operating from a 50V supply voltage, delivering best-in-class efficiency and linearity. The products will use industry-standard package footprints enabling customers to adopt NXP's products into existing designs without changing the mechanical design.

Next-generation GaN devices from NXP will be super-efficient, enabling a breakthrough in performance for the largest RF power market segment: cellular base stations. In turn this technology will enable a departure from linear amplifier topologies with the onset of switched mode power amplifier (SMPA) concepts. NXP's commitment to exploit the technology in a full portfolio of products will also lead to products for higher frequency applications up to 10 GHz.

GaN RF power amplifiers

2.6.2 Completing NXP's RF power transistor offering: products in plastic packages (OMP)

NXP is currently developing a complete line of overmolded plastic (OMP) RF power transistors and MMICs with peak powers ranging from 3 to 500 W. The main benefit of plastic packages is cost effectiveness with little or no impact on performance. The range of plastic devices will complement the extensive range of RF power products that NXP offers in ceramic packages for all frequency ranges and applications up to 2.45 GHz.

Products in development

- ▶ Single-stage broadband drivers in HSOP-outlines, from 3 to 10 W
- ▶ Single-stage OMP drivers from 25 to 45 W, replacing their ceramic equivalents for cost-sensitive applications
- ▶ Dual-stage MMICs from 30 to 60 W that can be used as high-gain drivers or combined as low-power dual-stage Doherty amplifiers
- ▶ Fully integrated plug-and-play Doherty PAs in a single package (50 to 100 W)
- ▶ Final transistors in OMP package (SOT502-sized) ranging from 140 to 200 W in frequency bands from 730 MHz to 2.2 GHz
- ▶ Final transistors in OMP package (SOT502-sized) ranging from 3 to 500 W in ISM frequency bands from a few MHz up to 2.45 GHz

Some of these products are available for sampling now, while the rest of the portfolio will be rolled out throughout 2012.

RF power products in plastic packages (OMP)

Type	f_{\min} (MHz)	f_{\max} (MHz)	P1dB (W)	Matching	Package	Description

2.6.3 Looking for a leader in SiGe:C? You just found us!

NXP QUBiC4 process technology

NXP's innovative, high-performance SiGe:C QUBiC4 process lets customers implement more functions into less space, with the added benefits of competitive cost, superb reliability, and significant manufacturing advantages. Our state-of-the-art QUBiC4 technology and extensive IP availability speed the migration from GaAs components to silicon by enabling cutting-edge products with best-in-class low noise performance, linearity, power consumption, immunity to out-of-band signals, spurious performance, and output power. QUBiC is a mature process that has been in mass production since 2002 and has had continuous performance upgrades added ever since. The QUBiC4 process is automotive-qualified and dual-sourced in two high-volume, NXP-owned 8-inch waferfabs that provide flexible, low-cost manufacturing with high yields and very low ppm in the field.

There are three QUBiC4 variants, each with its own benefits for specific application areas

QUBiC4+

The QUBiC4+ BiCMOS process features 0.25 μm CMOS with 5 metal layers for integration of dense digital logic-based smart functionality, a rich set of active and passive devices for high-frequency mixed-signal designs, including thick top metal layers for high-quality inductors. The device set includes 35 GHz f_T NPNs with 3.8 V breakdown voltage (BV_{ce0}) and low noise figure ($NF < 1.1 \text{ dB @ } 2 \text{ GHz}$), 5 GHz f_T VPNNs, a 28 GHz high-voltage NPN with 5.9 V breakdown voltage, differential and single-ended varicaps with Q-factor > 30 , scalable inductors with Q-factor > 20 , 800 MHz FT lateral PNNs, 0.25 μm CMOS, 137, 220 & 12 to 2000 ohm/sq. poly and active resistors, a 270 ohm/sq. SiCr thin film resistor, a 5.7 fF/ μm^2 oxide capacitor and a 5 fF/ μm^2 MIM capacitor, 1 to 6 fF/ μm^2 oxide capacitors and various other devices including L-PNNs, isolated NMOS, 3.3 V CMOS and RF-CMOS transistors capacitor. The QUBiC4+ process is silicon-based and ideal for applications up to 5 GHz ($f_T = 35 \text{ GHz}$, $NF < 1.1 \text{ dB @ } 2 \text{ GHz}$), as well as for medium power amplifiers up to 33 dBm.

QUBiC4X

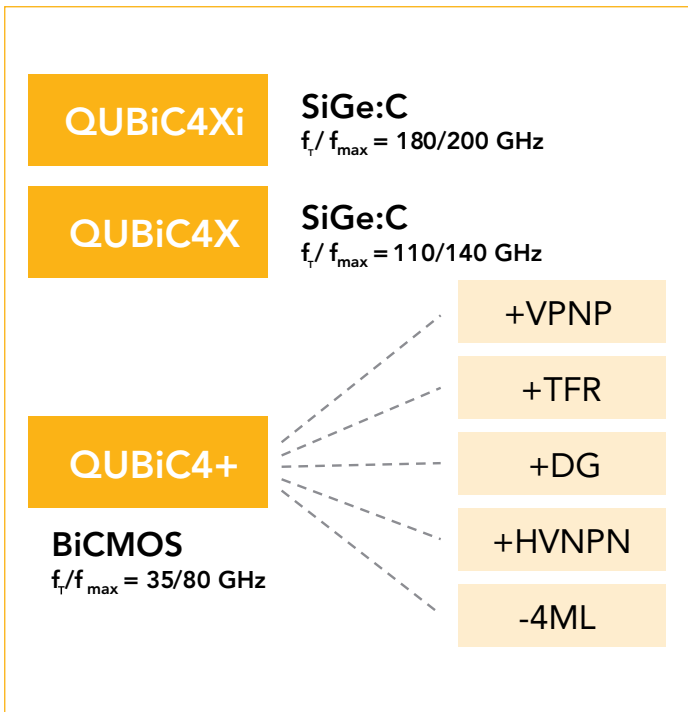

The QUBiC4X BiCMOS process is a SiGe:C-based extension of the QUBiC process for high-frequency mixed-signal designs and offers a rich set of devices, including a 110 GHz f_T NPN with 2.0 V breakdown voltage and very low noise figure ($NF < 1.0 \text{ dB @ } 10 \text{ GHz}$), 0.25 μm CMOS, a variety of resistors, a 5.7 fF/ μm^2 oxide capacitor, and a 5 fF/ μm^2 MIM capacitor.

The QUBiC4X is ideal for applications that typically operate at up to 30 GHz ($f_T = 110 \text{ GHz}$, $NF < 1.0 \text{ dB @ } 10 \text{ GHz}$) and ultra-low noise applications such as LNAs and mixers.

QUBiC4Xi

The QUBiC4Xi BiCMOS process further enhances the QUBiC4X process and offers an additional feature set of devices for high-frequency mixed-signal designs. These include 180 GHz f_T NPNs with 1.4 V breakdown voltage and ultra-low noise figure ($NF < 0.7 \text{ dB @ } 10 \text{ GHz}$), 0.25 μm CMOS, several resistors, a 5.7 fF/ μm^2 oxide capacitor and a 5 fF/ μm^2 MIM capacitor. QUBiC4Xi represents the newest SiGe:C process, with improved f_T ($> 200 \text{ GHz}$) and even lower noise figure ($NF < 0.6 \text{ dB @ } 10 \text{ GHz}$). It is ideal for applications beyond 30 GHz, such as LO generators.

QUBiC4+

- ▶ Baseline, 0.25 μm CMOS, single poly, 5 metal
- ▶ Digital gate density 26k gates/ mm^2
- ▶ $f_T/f_{MAX} = 35/80$ GHz
- ▶ +TFR – Thin Film Resistor
- ▶ +DG – Dual Gate Oxide MOS
- ▶ +HVNPN – High Voltage NPN
- ▶ +VPNP – Vertical PNP (high V_{early})
- ▶ -4ML – high-density 5fF/ μm^2 MIM capacitor
- ▶ Wide range of active and high-quality passive devices
- ▶ Optimized for up to 5 GHz applications

QUBiC4X

- ▶ SiGe:C process
- ▶ $f_T/f_{MAX} = 110/140$ GHz
- ▶ Optimized for applications up to 30 GHz

QUBiC4Xi

- ▶ SiGe:C process
- ▶ Improves f_T/f_{max} up to 180/200 GHz
- ▶ Optimized for ultra-low noise microwave above 30 GHz

Mask count	32 (MIM) / 34 / 33 (HVNPN) / 35 (VPNP)	36 (MIM)	36 (MIM)

2.6.4 High-performance, small-size packaging enabled by NXP's leadless package platform and WL-CSP technology

RF small-signal packaging is driven by two major trends which partly overlap

- ▶ Lower parasitics for better RF performance
- ▶ Smaller form factors for portable applications

To cope with these trends, NXP uses several approaches

- ▶ For non-space-restricted applications the use of flat-pack packages instead of gull-wing versions reduces the parasitic impedance because of shorter lead length (e.g. SOT343F instead of SOT343). This results in better RF performance in the Ku and Ka bands (13-20GHz). To reduce PCB board space, a smaller version (SOT1206) is also available.

SOT343

SOT343F

SOT1206

- ▶ For space-restricted applications there are two routes to reduce the form factor and parasitics:
 - Leadless package platform
 - Wafer Level Chip Scale Package (WL-CSP) technology

The **leadless package (UTLP) platform** (>25 variants already released) is highly flexible with respect to package size, package height, and I/O pitch. For example, the 6-pin packages range in size from 1.45 x 1 x 0.5 mm with 0.5 mm pitch to 0.8 x 0.8 x 0.35 mm with 0.3 mm pitch. Package height of 0.25 mm is planned.

Because of the compact size of the design, wire lengths and parasitic impedance are also restricted. The absence of leads further reduces the inductance.

Wafer Level Chip Scale Package technology is ideally for RF functions where the I/O pitch has to fit within the chip area. With larger pitches and smaller designs (and thus little effective chip area), it is more cost-effective to do the fan-out using a leadless package instead of increasing the chip size.

The absence of wires gives the lowest parasitic inductance available.

SOT886

SOT891

SOT1208

0.65 x 0.44 x 0.29 mm (incl. 0.09 mm balls)
5 I/Os @ 0.22 mm pitch

3. Products by function

NXP RF product catalog:
<http://www.nxp.com/rf>

3.1 New products

DEV = in development

CQS = customer qualification samples

RFS = release for supply

Type	Application / description	Expected status June 2012	Planned release	Section
------	---------------------------	---------------------------	-----------------	---------

NEW: Wideband transistors

BFU730LX	Gen7 wideband transistor	RFS	Released	3.3.1
----------	--------------------------	-----	----------	-------

NEW: SiGe:C LNAs (for e.g. GPS)

BGU8007	GPS LNA, 19.0 dB gain, AEC-Q100	RFS	Released	3.4.1
BGU7003W	General-purpose unmatched LNA for FM radio	RFS	Released	3.4.1
BGU6101	Unmatched wideband MMIC w/ bias enable function & wide range of supply voltage	RFS	Released	3.4.1
BGU6102	Unmatched wideband MMIC w/ bias enable function & wide range of supply voltage	RFS	Released	3.4.1
BGU6104	Unmatched wideband MMIC w/ bias enable function & wide range of supply voltage	RFS	Released	3.4.1

NEW: LNAs for set-top boxes

BGU7044	LNA for STB tuning	RFS	Released	3.4.1
BGU7045	LNA for STB tuning	RFS	Released	3.4.1

NEW: General-purpose wideband amplifiers (50 Ω gain blocks)

BGA2874	IF gain block 30.5 dB, 2.5 V	RFS	Released	3.4.1
BGA2817	IF gain block 24 dB, 3 V	RFS	Released	3.4.1
BGA2818	IF gain block 31 dB, 3 V	RFS	Released	3.4.1
BGA2851	IF gain block 25 dB, 5 V	RFS	Released	3.4.1
BGA2867	IF gain block 27 dB, 5 V	RFS	Released	3.4.1
BGA2869	IF gain block 32.5 dB, 5 V	RFS	Released	3.4.1

NEW: Medium power amplifier MMICs

BGA7014	Medium power amplifier, 12.0 dB, 13.0 dBm P1dB, SOT89	Dev	Q4 2012	3.4.1
BGA7017	Medium power amplifier, 13.5 dB, 16.5 dBm P1dB, SOT89	Dev	Q4 2012	3.4.1
BGA7020	Medium power amplifier, 13.0 dB, 18.5 dBm P1dB, SOT89	Dev	Q4 2012	3.4.1
BGA7130	Medium power amplifier, 18.0 dB, 30 dBm P1dB, SOT908	RFS	Released	3.4.1

NEW: VGAs for wireless infrastructures

BGA7351	50 MHz to 250 MHz high linearity variable gain amplifier - 28 dB gain range	RFS	Released	3.4.1
BGA7210	400 MHz to 2750 MHz high linearity variable gain amplifier	RFS	Released	3.4.1
BGA7204	700 MHz to 3800 MHz high linearity variable gain amplifier	RFS	Released	3.4.1

NEW: LNAs for wireless infrastructures

BGU7051	LNA 900 MHz - from 0.5 to 1.5 GHz	RFS	Released	3.4.1
BGU7052	LNA 1.9 GHz - from 1.5 to 2.5 GHz	RFS	Released	3.4.1
BGU7053	LNA 2.5 GHz - from 2.3 to 2.8 GHz	RFS	Released	3.4.1
BGU7060	LNA with variable gain from 700 to 800 MHz	RFS	Released	3.4.1
BGU7061	LNA with variable gain from 700 to 950 MHz	RFS	Released	3.4.1
BGU7062	LNA with variable gain from 1710 to 1785 MHz	RFS	Released	3.4.1
BGU7063	LNA with variable gain from 1920 to 1980 MHz	RFS	Released	3.4.1

Type	Application / description	Expected status June 2012	Planned release	Section
------	---------------------------	---------------------------	-----------------	---------

NEW: PLL + VCO (LO generator) for wireless infrastructures

BGX7300	Rx LO generator, 400 MHz to 3 GHz	DEV	Q4 2012	3.4.2
---------	-----------------------------------	-----	---------	-------

NEW: IQ modulators for wireless infrastructures

BGX7100	IQ modulator, output power 0 dBm	RFS	Released	3.4.2
BGX7101	IQ modulator, output power 4 dBm	RFS	Released	3.4.2

NEW: Dual mixers for wireless infrastructures

BGX7220	Dual mixer, NF 8 dB, IIP3 30 dBm, P < 1 W, 700 MHz to 1.2 GHz	RFS	Released	3.4.2
BGX7221	Dual mixer, NF 10 dB, IIP3 23 dBm, P < 1 W, 1.7GHz to 2.7 GHz	RFS	Released	3.4.2

NEW: RF power transistors for base stations

BLF6G15L(S)-40RN	Gen6 ceramic driver LDMOS transistor for GSM, WCDMA & LTE applications	RFS	Released	3.7.1
BLF6H10L(S)-160	Gen6 ceramic high-voltage LDMOS transistor for GSM, WCDMA & LTE applications	DEV	Q312	3.7.1
BLF7G20LS-260A	Gen7 ceramic asymmetrical Doherty LDMOS transistor for GSM & LTE applications	DEV	Q412	3.7.1
BLF7G24L(S)-160P	Gen7 ceramic push-pull LDMOS transistor for WCDMA & LTE applications	RFS	Released	3.7.1
BLF7G27LS-90PG	Gen7 ceramic push-pull LDMOS transistor for WCDMA & LTE applications (gull-wing)	RFS	Released	3.7.1
BLF8G10L(S)-160V	Gen8 ceramic LDMOS transistor for GSM, WCDMA & LTE applications	RFS	Released	3.7.1
BLF8G10LS-200GV	Gen8 ceramic LDMOS transistor for GSM, WCDMA & LTE applications (gull-wing)	DEV	Q412	3.7.1
BLF8G10LS-270GV	Gen8 ceramic LDMOS transistor for GSM, WCDMA & LTE applications (gull-wing)	DEV	Q412	3.7.1
BLF8G10L(S)-300P	Gen8 ceramic push-pull LDMOS transistor for GSM, WCDMA & LTE applications (gull-wing)	DEV	Q312	3.7.1
BLF8G10LS-400PGV	Gen8 ceramic push-pull LDMOS transistor for GSM, WCDMA & LTE applications (gull-wing)	DEV	Q412	3.7.1
BLF8G20L(S)-200V	Gen8 ceramic LDMOS transistor for GSM & LTE applications	RFS	Released	3.7.1
BLF8G20LS-270GV	Gen8 ceramic LDMOS transistor for GSM & LTE applications (gull-wing)	DEV	Q412	3.7.1
BLF8G20LS-270PGV	Gen8 ceramic push-pull LDMOS transistor for GSM & LTE applications (gull-wing)	DEV	Q412	3.7.1
BLF8G22LS-160BV	Gen8 ceramic LDMOS transistor for WCDMA & LTE applications	RFS	Released	3.7.1

NEW: RF power transistors for broadcast / ISM applications

BLF174XR(S)	XR ceramic push-pull LDMOS transistor for ISM applications	DEV	Q312	3.7.2
BLF178XR(S)	XR ceramic push-pull LDMOS transistor for FM broadcast & ISM applications	RFS	Released	3.7.2
BLF2425M6L(S)180P	Gen6 ceramic push-pull LDMOS transistor for 2.45 GHz ISM applications	DEV	Q312	3.7.2
BLF2425M7L(S)140	Gen7 ceramic LDMOS transistor for 2.45GHz ISM applications	RFS	Released	3.7.2
BLF2425M7L(S)200	Gen7 ceramic LDMOS transistor for 2.45GHz ISM applications	DEV	Q412	3.7.2
BLF2425M7L(S)250P	Gen7 ceramic push-pull LDMOS transistor for 2.45 GHz ISM applications	RFS	Released	3.7.2
BLF25M612(G)	Gen6 ceramic LDMOS driver transistor for 2.45 GHz ISM applications (gull-wing)	DEV	Q312	3.7.2
BLF572XR(S)	XR ceramic push-pull LDMOS transistor for ISM applications	DEV	Q412	3.7.2
BLF574XR(S)	XR ceramic push-pull LDMOS transistor for ISM applications	DEV	Q312	3.7.2
BLF578XR(S)	XR ceramic push-pull LDMOS transistor for UHF broadcast & ISM applications	RFS	Released	3.7.2
BLF647P(S)	Ceramic push-pull LDMOS transistor for broadband applications	DEV	Q312	3.7.2

Type	Application / description	Expected status June 2012	Planned release	Section
------	---------------------------	------------------------------	-----------------	---------

NEW: RF power transistors for aerospace and defense

BLL6G1214LS-250	Gen6 ceramic LDMOS transistor for L-band applications	RFS	Released	3.7.3
BLL6H1214LS-500	Gen6 high-voltage ceramic LDMOS transistor for L-band applications	DEV	Q412	3.7.3
BLS6G2735L(S)-30	Gen6 ceramic LDMOS driver transistor for S-band radar applications	RFS	Released	3.7.3
BLS7G2729L(S)-350P	Gen7 ceramic push-pull LDMOS transistor for S-band radar applications	RFS	Released	3.7.3
BLS7G3135L(S)-350P	Gen7 ceramic push-pull LDMOS transistor for S-band radar applications	DEV	Q412	3.7.3
BLU6H0410L(S)-600P	Gen6 high-voltage ceramic push-pull LDMOS transistor for UHF band radar applications	RFS	Released	3.7.3

NEW: Gallium Nitride (GaN) RF power amplifiers

CLF1G0060-10	Gen1 GaN broadband amplifier	DEV	Q113	3.7.4
CLF1G0060-30	Gen1 GaN broadband amplifier	DEV	Q113	3.7.4
CLF1G0035-50	Gen1 GaN broadband amplifier	DEV	Q312	3.7.4
CLF1G0035-100	Gen1 GaN broadband amplifier	DEV	Q412	3.7.4

NEW: Low-power wireless microcontrollers and networking stacks

JN5142-J01	JenNet-IP	RFS	Released	3.8
JN5142-001	RF4CE / IEEE802.15.4	RFS	Released	3.8
JN5148-J01	JenNet-IP	RFS	Released	3.8
JN5148-001	JenNet / IEEE802.15.4	RFS	Released	3.8
JN5148-Z01	ZigBee	RFS	Released	3.8
JN5148-001-M00	JenNet / IEEE802.15.4	RFS	Released	3.8
JN5148-001-M03	JenNet / IEEE802.15.4	RFS	Released	3.8
JN5148-001-M04	JenNet / IEEE802.15.4	RFS	Released	3.8
JenNet	Networking stack	RFS	Released	3.8
JenNet-IP	Networking stack	RFS	Released	3.8
ZigBee PRO	Networking stack	RFS	Released	3.8

3.2 RF diodes

3.2.1 Varicap diodes

Varicap selection guide on www.nxp.com/varicaps
Easy-to-use parametric filters help you choose the right varicap for your design.

Why choose NXP's varicap diodes:

- ▶ Reference designs for TV and radio tuning
- ▶ Direct matching process
- ▶ Small tolerances
- ▶ Short lead time
- ▶ Complete portfolio covering broad range of frequencies and packages (including leadless)
- ▶ Reliable volume supply

VCO and FM radio tuning varicap diodes

Type	Package	Number of diodes	Config-uration	@ f = 1 MHz												r _s typ	r _s max	@ f =

3.2.2 PIN diodes

PIN diode selection guide on www.nxp.com/pindiodes
Easy-to-use parametric filters help you choose the right PIN diode for your design.

Why choose NXP's PIN diodes:

- ▶ Broad portfolio
- ▶ Unrivalled performance
- ▶ Short lead time
- ▶ Low series inductance
- ▶ Low insertion loss
- ▶ Low capacitance

For more information: www.nxp.com/pindiodes

3.2.3 Band-switch diodes

Why choose NXP's band-switch diodes:

- ▶ Reliable volume supplier
- ▶ Short lead time
- ▶ Low series inductance
- ▶ Low insertion loss
- ▶ Low capacitance
- ▶ High reverse isolation

Type	Package	V_R max (V)	IF max (mA)	r_D max (Ω)	@ IF = (mA)	@ f = (MHz)	C_d max (pF)	@ V_R = (V)	@ f = (MHz)

3.2.4 Schottky diodes

Schottky diode selection guide on www.nxp.com/rfschottkydiodes
 Easy-to-use parametric filters help you choose the right Schottky diode for your design.

Why choose NXP's Schottky diodes:

- ▶ Low diode capacitance
- ▶ Low forward voltage
- ▶ Single- and triple-isolated diode
- ▶ Small package

Applications

- ▶ Digital applications:
 - Ultra high-speed switching
 - Clamping circuits
- ▶ RF applications:
 - Diode ring mixer
 - RF detector
 - RF voltage doubler

Low-capacitance Schottky diodes

3.3 RF Bipolar transistors

3.3.1 Wideband transistors

RF wideband transistor selection guide on www.nxp.com/rftransistors
Easy-to-use parametric filters help you choose the right RF wideband transistor for your design.

Why choose NXP's wideband transistors:

- ▶ Broad portfolio (1st - 7th generation)
- ▶ Short lead time
- ▶ Smallest packages
- ▶ Volume delivery

Wideband transistors

The f_T - I_C curve represents transition frequency (f_T) characteristics as a function of collector current (I_C) for the seven generations of RF wideband transistors. A group of transistors having the same I_C and similar f_T represents a curve. The curve number matches with products in the selection tables of this section (third column of each table), detailing their RF characteristics.

Wideband transistors line-up per frequency

3.4 RF ICs

3.4.1 RF MMIC amplifiers and mixers

RF MMIC amplifiers and mixers selection guide on www.nxp.com/mmics

Easy-to-use parametric filters help you choose the right zRF MMIC for your design.

Why choose NXP's RF MMIC amplifiers and mixers:

- ▶ Reduced RF component count
- ▶ Easy circuit design-in
- ▶ Reduced board size
- ▶ Short time-to-market
- ▶ Broad portfolio
- ▶ Volume delivery
- ▶ Short lead time

General-purpose wideband amplifiers (50 Ω)

3.4.4 Low-noise LO generators for VSAT and general microwave applications

Why choose NXP's low-noise LO generators:

- ▶ Lowest total cost of ownership
- ▶ Alignment-free concept
- ▶ Easy circuit design-in
- ▶ Improved LO stability

Low-noise LO generators for VSAT applications

Type	Package	f _{IN(REF)} (MHz)	V _{cc}	I _{cc}	PLL phase noise @ N=64, @ 100 kHz Max (dBc/Hz)	PLL f _{o(RF)} (GHz)	Output buffer		Input
			Typ (V)	Typ (mA)			P _o Typ (dBm)	R _{Lout(RF)} Max (dB)	S _i Min (dBm)
			TFF1003HN	SOT616		50 - 815	3.3	100	-92

3.5 RF MOS transistors

3.5.1 JFETs

JFET selection guide on www.nxp.com/rffets

Easy-to-use parametric filters help you choose the right junction field effect transistor for your design.

Why choose NXP's JFETs:

- ▶ Reliable volume supplier
- ▶ Short lead time
- ▶ Broad portfolio

3.5.2 MOSFETs

RF MOSFET selection guide on www.nxp.com/rfets Easy-to-use parametric filters help you choose the right RF MOSFET for your design.

Why choose NXP's MOSFETs:

- ▶ Reference designs for TV tuning
- ▶ Short lead time
- ▶ Broad portfolio
- ▶ Smallest packages
- ▶ 2-in-1 FETs for tuner applications
- ▶ Reliable volume supply
- ▶ Best performance MOSFETs for TV tuning

N-channel, single MOSFETs for switching

Type	Package	V _{DS} (V)	Characteristics														
			I _D (mA)	I _{DSS} (mA)		V _{GS(th)} (V)		R _{DS(on)} (Ω)	C _{rs} (pF)		t _{on} (ns)		t _{off} (ns)		S _{21(on)} ₂ (dB)	S _{21(off)} ₂ (dB)	MODE

3.6 RF modules

CATV module selection guide on www.nxp.com/catv
Easy-to-use parametric filters help you choose the right CATV module for your design.

Why choose NXP's RF modules:

- ▶ Excellent linearity, stability, and reliability
- ▶ Rugged construction
- ▶ Extremely low noise
- ▶ High power gain
- ▶ Low total cost of ownership

CATV types for Chinese (C-types) and 1 GHz GaAs HFET line-ups

The C-types are specially designed for the Chinese market, customized for two major governmental projects. The GaAs HFET family includes a complete 1 GHz line-up for high-end applications around the world.

C-types (China)

- ▶ CATV push-pulls, section 3.6.2: BGY588C, BGE788C, CGY888C
- ▶ CATV power doublers, section 3.6.3: BGD712C, CGD982HCi, CGD985HCi, CGD987HCi
- ▶ CATV optical receivers, section 3.6.4: BGO807C, BGO807CE

1 GHz GaAs HFET high-end hybrids

- ▶ CATV push-pulls, section 3.6.2 : CGY1032, CGY1041, CGY1043, CGY1047, CGY1049
- ▶ CATV power doublers, section 3.6.3: CGD1040Hi, CGD1042Hi, CGD1044Hi, CGD1046Hi, CGD1042H, CGD1044H

⁽¹⁾ Frequency range: minimum and maximum frequency in MHz at which data are characterized (@ Ch / @ Vo)

⁽²⁾ FL is flatness of frequency response

⁽³⁾ The number of channels and the output voltage at which CTB, X_{mod}, CSO, IMD2, and IMD3 are characterized, are @ f_{max}

⁽⁴⁾ S is minimum responsivity of optical receivers

3.7 RF power transistors

NEW: RF power transistor selection guide on www.nxp.com/rfpower
Easy-to-use parametric filters help you choose the right RF power transistor for your design.

3.7.1 RF power transistors for base stations

Device naming conventions RF power transistors for base stations

Why choose NXP's RF power transistors for base stations:

- ▶ Leading technology (generations 6, 7, and 8 of LDMOS)
- ▶ Highest efficiency
- ▶ Best ruggedness
- ▶ Advanced Doherty amplifier designs
- ▶ Very broad band (video bandwidth enhanced) devices
- ▶ Industry's first 3.8 GHz Doherty
- ▶ Industry's first three-way, 900 MHz Doherty
- ▶ Industry's first 50 V, 600 W, single-package Doherty

NXP offers complete line-ups of RF power transistors operating from 800 MHz right up to 3.8 GHz for base stations, covering all cellular technologies [MC-GSM/EDGE, TDMA, (TD-S)CDMA, W-CDMA/UMTS, LTE] and WiMAX infrastructures.

3.7.1.1 0.7 - 1.0 GHz line-up

Type	Product	f _{min} (MHz)	f _{max} (MHz)	P1dB (W)	Matching	Test signal performance						Test signal	Package

3.7.2 RF power transistors for broadcast / ISM applications

Why choose NXP's RF power transistors for broadcast / ISM applications:

- ▶ Highest power
- ▶ Best ruggedness
- ▶ Best broadband performance
- ▶ Best-in-class design support
- ▶ Very low thermal resistance design for unrivalled reliability

NXP's leading LDMOS technologies, together with advanced package concepts, enable power amplifiers that deliver best-in-class performance. We offer the industry's highest power and best ruggedness for all broadcast technologies. Our portfolio includes transistors for Ultra High Frequency (UHF), Very High Frequency (VHF), and High Frequency (HF) applications and covers ISM frequency bands.

3.7.2.1 0-1000 MHz (UHF/VHF/HF/ISM) LDMOS line-up

3.7.3 RF power transistors for aerospace and defense

Device naming conventions RF power transistors for aerospace and defense

Why choose NXP's microwave RF power transistors

- ▶ High gain
- ▶ High efficiency
- ▶ Highest reliability
- ▶ Improved pulse droop and insertion phase
- ▶ Improved ruggedness - overdrive without risk to +5 dB
- ▶ Reduces component count and helps simplify L- and S-band radar design
- ▶ Uses non-toxic, RoHS-compliant packages

3.7.3.1 Avionics LDMOS transistors

3.7.4 Gallium Nitride (GaN) RF power amplifiers

Device naming conventions GaN RF power amplifiers

C	L	F	1G	0040	S	#	P
P: push-pull indicator, P = push-pull type; no P means single-ended transistor							
2 to 1500: nominal P3dB in Watts: eg 50 = 50W							
S: earless type, S = earless; no S means eared package							
35 to 60: upper frequency, 10x GHz value: 35 = 3.5GHz; 60 = 6.0GHz							
00 to 40: lower frequency, 10x GHz value: 00 = 0GHz or DC; 40 = 4.0GHz							
1G: technology generation: 1G = 1st generation							
F: package style: F = ceramic, P = overmolded plastic							
L: high frequency power transistor							
C: primary material identifier: C = wide band-gap compound materials, eg GaN							

Type	f _{min} (MHz)	f _{max} (MHz)	P _{out} (W)	Matching	VDS (V)	η _D (%)	G _p (dB)	Test signal	Package	Applications
CLF1G0060-10*	0	6000	10	-	50	54	14	Pulsed	SOT1227	Cellular, WiMAX, ISM, avionics, S-band, general purpose
CLF1G0060-30*	0	6000	30	-	50	54	14	Pulsed	SOT1227	Cellular, WiMAX, ISM, avionics, S-band, general purpose
CLF1G0035-50*	0	3500	50	-	50	54	14.2	Pulsed	SOT467	Cellular, WiMAX, ISM, avionics, S-band, general purpose
CLF1G0035-100*	0	3500	100	-	50	52	14.8	Pulsed	SOT467	Cellular, WiMAX, ISM, avionics, S-band, general purpose

3.8 Wireless microcontroller chipsets and modules

Type	Module/single chip	Application	TX power	Receiver sensitivity	TX current	RX current	Operating voltage	Form factor
JN5148-001-M00	Module	2.4-2.4835 GHz JenNet & IEEE802.15.4	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	Integral antenna 18 x 32 mm
JN5148-001-M03	Module	2.4-2.4835 GHz JenNet & IEEE802.15.4	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	U.FL connector 18 x 30 mm
JN5148-001-M04	Module	2.4-2.4835 GHz JenNet & IEEE802.15.4	+20 dBm	-98 dBm	110mA	23 mA	2.7-3.6 V	U.FL connector 18 x 41 mm
JN5142-J01	Single chip	2.4-2.4835 GHz JenNet-IP	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	6 x 6 mm QFN40
JN5148-J01	Single chip	2.4-2.4835 GHz JenNet-IP	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	8 x 8 mm QFN56
JN5142-001	Single chip	2.4-2.4835 GHz RF4CE & IEEE802.15.4	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	6 x 6 mm QFN40
JN5148-001	Single chip	2.4-2.4835 GHz JenNet & IEEE802.15.4	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	8 x 8 mm QFN56
JN5148-Z01	Single chip	2.4-2.4835 GHz ZigBee PRO	+2.5 dBm	-95 dBm	15 mA	17.5 mA	2.3-3.6 V	8 x 8 mm QFN56

Bold red = new, highly recommended product

* Check status in section 3.1, as this type is not yet released for mass production

4. Design support

This chapter will guide you through the available tools, documents, materials, and links that ease the design-in of our products.

4.1 Knowing NXP's RF portfolio

Beyond this RF Manual, you can learn about NXP's broad RF portfolio through the NXP Technical Academy, various webinars and the NXP channel on YouTube.

The NXP Technical Academy provides training modules where you can learn about our products and applications, watch hands-on trainings and even get certified! The training modules can be viewed on mobile devices as well.

NXP provides RF webinars on a regular basis. (www.nxp.com/news/meet-nxp/webinars-and-podcasts.html#rf)

On NXP's YouTube channel (www.youtube.com/user/nxpsemiconductors), there are short videos that explain NXP's portfolio, application information, tips and tricks to optimize your systems performance, and more.

4.2 Product selection on NXP.com

Every RF product has its own webpage on the NXP website. Pages can be accessed in several ways: by product tree, by application area, or via cross-reference search. Or, simply type 'nxp <product>' in the Google search bar.

Product tree and parametric search

The product tree (www.nxp.com/products/rf) categorizes the product by function. The parametric search tool allows you to refine the selection based on performance requirements.

Application area

To find out what NXP offers in each application area, use the Explore Application section of the NXP website.

Cross reference

NXP maintains a cross-reference of competitor products and NXP alternatives. This list can be searched online via the search tool bar on the NXP website or off-line by installing the X-Reference-Tool.

4.3 Product evaluation

NXP offers a broad range of support material for evaluating RF products and optimizing the performance of your application.

Data sheets and application notes

The first chapter of this RF Manual includes application diagrams, recommended type numbers, and product highlights. More in-depth application information is available in the second chapter, in product data sheets or in the Application Notes section of the NXP website (www.nxp.com/products/all_appnotes).

Simulation tools

To help you evaluate our products in your specific application, NXP offers various simulation tools, including small-signal touchstone S-parameters and parametric models that let you customize the biasing conditions. The parametric models are based on best-in-class Mextram models and RFLDMOS models developed by Philips Research, a recognized leader in physics-based models. The parametric models fully support AC, DC, S-parameter, harmonic balance, and time-domain simulations. These models allow designers to assess the performance of complex systems at an early stage of the development process.

The models are available for Advanced Design System (ADS), Microwave Office (MWO) and Ansoft Designer. Spice versions of the parametric models, which can be used with almost any commercial design tool, are also available.

Customer evaluation kits and samples

Several kits are available for evaluation of our products. Boards are provided with industry-standard RF connectors to facilitate measurements and integration in your application. The features and content of each kit are described on the NXP website and are listed on the corresponding product page. On the Customer Evaluation Kits page you can also find support materials, such as the latest user manuals and software updates. You can order small quantities of all products to build and evaluate prototypes. To obtain a kit or order samples, please contact your local NXP representative or authorized distributor.

4.4 Additional design-in support

If you need additional design-in support, please contact your local NXP sales representative or authorized distributor. You can also submit a question using the web form on the NXP website.

4.5 Application notes

Product category	Filename	Description
Amplifiers	AN11152	Reducing the Spurs at RF_out caused by the biasing choke during fast switching on and off in TDD system
Amplifiers	AN11148	BGU7003 1900MHz to 2100MHz LNA Application
PLL's and Oscillators	AN11144	Universal Single LNB with TFF101x FIMOD IC
Amplifiers	AN11135	Replacing HMC625 by NXP BGA7204
Amplifiers	AN11130	Bias module for 50 V GaN demonstration boards
Transistors	AN11118	BFU725F/N1 1.5 GHz LNA evaluation board
Amplifiers	AN11103	Externally-matched 900 MHz LNA using BGU7005
Transistors	AN11102	BFU725F/N1 2.4 GHz LNA evaluation board
Amplifiers	AN11101	BGU7007 GPS front end evaluation board
Amplifiers	AN11091	Ohmic FM LNA for embedded Antenna in Portable applications with BGU6102
Amplifiers	AN11090	50 Ohm FM LNA for embedded Antenna in Portable applications with BGU6102
Amplifiers	AN11086	BGU7003 LNA application for GPS L2 band
Amplifiers	AN11072	BGU7003 400MHz and 900 MHz applicaiton
Amplifiers	AN11068	BGU7005 matching options for improved LTE jammer immunity
Transistors	AN11066	SDARS active antenna 1st stage LNA with BFU730F, 2.33 GHz
Amplifiers	AN11062	Broadband DVB-T UHF power amplifier with the BLF888A
Amplifiers	AN11035	50 Ohm FM LNA for embedded Antenna in Portable applications with BGU7003W
Amplifiers	AN11034	High Ohmic FM LNA for embedded Antenna in Portable applications with BGU7003W
Transistors	AN11024	SDARS active antenna 2nd stage LNA with BFU690, 2.33 GHz
Transistors	AN11010	Single stage Ku band LNA using BFU730F
Transistors	AN11007	Single stage 5-6 GHz WLAN LNA with BFU730F
Transistors	AN11006	Single stage 2.3_2.7GHz LNA with BFU730F
Amplifiers	AN10967	BLF578 demo for 352 MHz 1kW CW power
Amplifiers	AN10953	BLF645 10 MHz to 600 MHz 120 W amplifier
Amplifiers	AN10951	1805 MHz to 1880 MHz asymmetrical Doherty amplifier with the BLF7G20LS-90P and BLF7G21LS-160P
Amplifiers	AN10945	174 MHz to 230 MHz DVB-T power amplifier with the BLF881
Amplifiers	AN10944	1930 MHz to 1990 MHz Doherty amplifier using the BLF7G20LS-200
Amplifiers	AN10933	2.5 GHz to 2.7 GHz Doherty power amplifier using the BLF7G27LS-150P
Amplifiers	AN10923	1.5GHz Doherty power amplifier for base station applications using the BLF6G15L-250PBRN
Amplifiers	AN10921	BLF7G20LS-200 Doherty 1.805-1.88 GHz RF power amplifier
Amplifiers	AN10896	Mounting and Soldering of RF transistors
Amplifiers	AN10885	Doherty RF performance analysis using the BLF7G22LS-130
Amplifiers	AN10882	Dependency of BLF578 gate bias voltage on temperature
Amplifiers	AN10869	Broadband DVB-T UHF power amplifier with the BLF888
Amplifiers	AN10858	174 MHz to 230 MHz DVB-T power amplifier with the BLF578
Amplifiers	AN10847	Doherty RF performance using the BLF6G20-230PRN
Amplifiers	AN10800	Using the BLF578 in the 88 MHz to 108 MHz FM band
Amplifiers	AN10714	Using the BLF574 in the 88-108 MHz FM band

4.6 Simulation models

5. Cross-references & replacements

NXP cross-references:

<http://www.nxp.com/xref/nxp?typenumber>

NXP end-of-life:

<http://www.nxp.com/products/eol/>

5.1 Cross-references: manufacturer types versus NXP types

In alphabetical order of manufacturer type

Abbreviations:

Base station	Base station power transistors
Broadcasts	Broadcast power transistors
BS diode	Band switch diode
CATV OR	CATV optical receiver
CATV PD	CATV power doubler
CATV PPA	CATV push-pull amplifier
CATV PPA/HG	CATV push-pull amplifier high gain
CATV RA	CATV reverse amplifier
FET	Field-effect transistor
A&D	Microwave power transistors
MMIC	Monolithic microwave integrated circuit
Varicap	Varicap diode
WB trs 1-4	Wideband transistor 1-4 generation
WB trs 5-7	Wideband transistor 5-7 generation

Manufacturer type	Manufacturer	NXP type	Product family	Manufacturer type	Manufacturer	NXP type	Product family

5.2 Cross-references: NXP discontinued types versus NXP replacement types

In alphabetical order of manufacturer discontinued type

Abbreviations:

BS diode	Band switch diode
CATV	Community antenna television system
FET	Field effect transistor
Varicap	Varicap diode
WB trs	Wideband transistor
RFP trs	RF Power transistor

6. Packing and packaging information

6.1 Packing quantities per package with relevant ordering code

	Package	Package dimensions L x W x H (mm)	Packing quantity	Product 12NC ending	Packing method
	SOD323/SC-76	1.7 x 1.25 x 0.9	3,000	115	8 mm tape and reel
			10,000	135	8 mm tape and reel
	SOD523/SC-79	1.2 x 0.8 x 0.6	3,000	115	8 mm tape and reel
			10,000	135	8 mm tape and reel
			8,000	315	2 mm pitch tape and reel
			20,000	335	2 mm pitch tape and reel
	SOD882D	1.0 x 0.6 x 0.4	10,000	315	reel
	SOT23	2.9 x 1.3 x 0.9	3,000	215	8 mm tape and reel
			10,000	235	8 mm tape and reel
	SOT54	4.6 x 3.9 x 5.1	5,000	112	bulk, delta pinning
			5,000	412	bulk, straight leads
			10,000	116	tape and reel, wide pitch
			10,000	126	tape ammpack, wide pitch
	SOT89/SC-62	4.5 x 2.5 x 1.5	1,000	115	12 mm tape and reel
			4,000	135	12 mm tape and reel
	SOT115	44.5 x 13.65 x 20.4	100	112	4 tray/box
	SOT143(N/R)	2.9 x 1.3 x 0.9	3,000	215	8 mm tape and reel
			10,000	235	8 mm tape and reel
	SOT223/SC-73	6.7 x 3.5 x 1.6	1,000	115	12 mm tape and reel
			4,000	135	12 mm tape and reel
	SOT307	10 x 10 x 1.75	1,500	518	13" tape and reel dry pack
			96	551	1 tray dry pack
			480	557	5 tray dry pack

6.2 Marking codes

In general, device marking includes the part number, some manufacturing information and the NXP logo. If packages are too small for the full-length part number a shorter, coded part number – marking code – is used (where % = placeholder for manufacturing site code). The full-length part number is always printed on the packing label on the box or bulk-pack in which the devices are supplied.

p = made in Hong Kong

t = made in Malaysia

W = made in China

7. Abbreviations

3-way	Doherty design using 3 discrete transistors	MPPM	Main and peak device realized in same push-pull transistor (2 times)
AM	Amplitude Modulation	MoCA	Multimedia over Coax Alliance
ASIC	Application Specific Integrated Circuit	MOSFET	Metal–Oxide–Semiconductor Field Effect Transistor
ASYM	Asymmetrical design of Doherty (main and peak device are different)	MPA	Medium Power Amplifier
BPF	Band Pass Filter	MRI	Magnetic Resonance Imaging
BUC	Block Upconverter	NF	Noise Figure
CATV	Community Antenna Television	NIM	Network Interface Module
CDMA	Code Division Multiple Access	NMR	Nuclear Magnetic Resonance
CMMB	Chinese Multimedia Mobile Broadcasting	PA	Power Amplifier
CMOS	Complementary Metal Oxide Semiconductor	PAR	Peak to Average Ratio
CQS	Customer Qualification Samples	PEP	Peak Envelope Power
DAB	Digital Audio Broadcasting	pHEMT	pseudomorphic High Electron Mobility Transistor
DECT	Digital Enhanced Cordless Telecommunications	PLL	Phase Locked Loop
DiSEqC	Digital Satellite Equipment Control	QUBiC	Quality BiCMOS
DSB	Digital Signal Processor	RF	Radio Frequency
DVB	Digital Video Broadcasting	RFS	Release for Supply
EDGE	Enhanced Data Rates for GSM Evolution	RoHS	Restriction of Hazardous Substances
ESD	Electro Static Device	Rx	Receive
FET	Field Effect Transistor	SARFT	State Administration for Radio, Film and Television
FM	Frequency Modulation	SER	Serializer
GaAs	Gallium Arsenide	SiGe:C	Sillicon Germanium Carbon
GaN	Gallium Nitride	SMATV	Satellite Master Antenna Television
Gen	Generation	SMD	Surface Mounted Device
GPS	Global Positioning System	SPDT	Single Pole, Double Throw
GSM	Global System for Mobile communications	SYM	Symmetrical design of Doherty (main and peak device are the same type of transistor)
HBT	Heterojunction Bipolar Transistor	TD-SCDMA	Time Division-Synchronous Code Division Multiple Access
HDTV	High Definition Television	TCAS	Traffic Collision Avoidance Systems
HF	High Frequency (3-30 MHz)	TMA	Tower Mounted Amplifier
HFC	Hybrid Fiber Coax	TTF	Time to First Fix
HFET	Heterostructure Field Effect Transistor	Tx	Transmit
HPA	High Power Amplifier	UHF	Ultra High Frequency (470-860 MHz)
HVQFN	Plastic thermally enHanced Very thin Quad Flat pack No leads	UMTS	Universal Mobile Telecommunications System
IF	Intermediate Frequency	VCO	Voltage Controlled Oscillator
ISM	Industrial, Scientific, Medical - reserved frequency bands	VGA	Variable Gain Amplifier
LDMOS	Laterally Diffused Metal-Oxide-Semiconductor	VHF	Very High Frequency (30-300 MHz)
LNA	Low Noise Amplifier	VoIP	Voice over Internet Protocol
LNB	Low Noise Block	VSAT	Very Small Aperture Terminal
LO	Local Oscillator	WCDMA	Wideband Code Division Multiple Access
LPF	Low Pass Filter	WiMAX	Worldwide Interoperability for Microwave Access
MESFET	Metal Semiconductor Field Effect Transistor	WLAN	Wireless Local Area Network
MMIC	Monolithic Microwave Integrated Circuit		
MMPP	Main and peak devices realized separately in halves of push-pull transistor
